But the Assembly would not have been victorious if it had not in accordance with Sieyès' theory on the constituent power constituted itself a veritable dictatorship. The fundamental distinction between constitutional laws, exempted from royal sanction, and ordinary laws, which were alone subject to veto, provided a means of nullifying the evils of the royal will and of raising the new order.

The committees governed and at the same time administered by methods which the Convention was to do no more than take over and expand. They corresponded directly with the new authorities, gave them instructions which were tantamount to orders and treated the ministers as their agents.

The *Comité des rapports* and the *Comité des recherches*, which were in charge of political policing, kept themselves informed regarding the various municipalities, conducted investigations, issued orders for arrests and brought those apprehended before the Châtelet, which at the outset of the revolution served as the seat of the High Court. The renowned *Comité de sureté générale* of the Convention was to do no more. The *Comité diplomatique*, formed after the king had been shorn of his prerogative of declaring

war and making peace, received communications from ambassadors and was the dominant force in the direction of foreign policy. After December 19, 1789, the *Comité des finances* had its own special treasury called the *Caisse de l'Extraordinaire*, which was distinct from the royal treasury and filled with special contributions such as the *contribution patriotique*. Its chief responsibility, however, was the administration of the assignats and of the receipts accruing from the sale of national property. The *Comité de l'aliénation des biens nationaux*, charged as its name indicates with the sale of church property, divided France into twenty territorial districts and at the head of each of these placed one of its members. The active correspondence published by Raymond Delaby between Camus, head of one of these districts, and the department of Côte-d'Or indicates in a striking manner that contrary to a widely held opinion the locally elected authorities enjoyed no initiative in the interpretation or application of the laws. Camus insisted on being consulted in reference to all decisions made by the administration of the department which concerned national property. No anonymous notice of auctions could be published without his consent and his visa, and he concerned himself with the most minute details. The *Comité des droits féodaux* did not confine its activities to drawing up laws on the redeeming of the feudal dues of the nobles, but carried on an active correspondence with the local authorities, guiding them and making decisions on the practical difficulties submitted by them. Nor did the *Comité ecclésiastique* limit itself to elaborating the civil constitution of the clergy, which harmonized the older ecclesiastical organization with the new organization by departments. In addition it supervised at close range its actual application and made final decisions on all contentious points in the legislation affecting religion. The aristocrats could with some justification accuse it of having usurped the status of a conciliar body. One of its notable accomplishments was the inventories which it took of confiscated ecclesiastical furnishings in order to exempt from sale rare and precious objects. The *Comité militaire* from the outset worked in close touch with the Ministry of War and kept a sharp eye on the administration of the army in all its ramifications.

As a result of this elaborate system of committees the great principle of the separation of powers, which the Constituent borrowed from Montesquieu and wrote into the constitution of

1791 as the corner stone of essential liberties, was never applied or observed as long as the great assembly continued to function. Moreover, its members did not believe that they were going back on their own doctrines in vigorously usurping the dictatorship and in applying it on a large scale. Sieyès had taught them that they were the constituent power. Consequently the constitution would function only after their exit, when the powers which they had constituted would begin to be applied. Their dictatorship was justified by the obligation of clearing the way for these new powers. They were forced to remove all obstacles beforehand.

If Louis XVI had resigned himself to the position of constitutional monarch, the bourgeoisie would have kept him at the helm. All it asked of him was not to take the side of the privileged classes. But Louis XVI began to conspire. He was disgruntled at the curtailment of his power. He sought the aid of foreign kings. Within France he precipitated religious war. He fled to the frontier and was brought back humiliated. From that time on a new revolution was in process. The first had been that of the aristocracy; the second, of the bourgeoisie; the third was to be, in part at least, of the people both urban and rural.

The first revolution had forced the king to summon the Estates General. The second had suppressed the institutions of the *ancien régime*. The third overturned the throne. The first had been provoked by the resistance of the privileged classes to fiscal reforms. The fundamental cause of the second had been the fear of bankruptcy. The third sprang from foreign war and invasion. It was at once a patriotic and a popular revolution. It resulted in the liberation, at least partial and provisional, of the peasant and the worker.

Since the fall of the Bastille the peasants had been attacking the chateaux and had forced the nobles to surrender and burn the title deeds which authorized the collection of feudal dues. The artisans of the town had on their side burned the customs barriers and forced a reduction in prices. These disorderly popular outbursts had surprised and annoyed the bourgeois membership of the Constituent. Their permanent committees and their national guards were designed as much against the threat of the jacquerie from below as against that of the aristocracy from above. It was with bad grace that they granted concessions to the peasants. The legislation of August 20 and the following days

constituted but a very superficial suppression of the feudal regime, abolishing personal servitude but maintaining all the rest. The most immediately felt feudal dues, those in kind or in money, continued to be paid by the tenants, until they redeemed them. At the same time the Constituent deprived the people of the franchise. The new constitution handed over France to an oligarchy of men in possession.

If the bourgeoisie, victorious over the peasants as well as over the nobles, had remained united, the revolution would have been over. The discontented peasants continued to create sporadic disturbances, but in default of concerted action they were incapable of overturning by their own efforts the remnants of the feudal order or of dispossessing the bourgeoisie.

But after the flight of the king the bourgeoisie split into two factions. The Feuillants frightened by the possibility of democracy fired upon the republicans on the Champ de Mars, July 17, 1791. After the massacre they found themselves in the position of being forced to consolidate the royal power and, because of class egotism, of restoring to the crown a part of the force which it had lost. The other great faction, the Girondists, took the opposite course; defiant of the king and fearful of the reestablishment of absolutism, they opposed any backsliding. As a method of solving the internal difficulties of the country, of checking the priests and the aristocrats, of reissuing the assignats, of forcing the king to entrust them with power, they plunged the revolution into foreign war, despite the warnings of Robespierre and the Montagnards.

The war was the decisive event which underlay the third revolution, that of August 10, 1792. It brought in its train not only the fall of the monarchy, which trafficked with the enemy and worked for its victory, but also the confiscation of the property of émigrés serving in the Austrian and Prussian armies. And the confiscation of émigré property following the confiscation of church property completed the dispossession of the older ruling class. Moreover, the war resulted in the suppression without indemnification of those feudal dues which the Constituent had allowed to stand. The revolutionary bourgeoisie was forced to offer this bait to the peasants in order to interest them in victory. It was likewise forced in the same spirit and from the same necessity finally to abolish amid the booming of cannon directed against the Tuileries the distinction between active citizen and passive citizen—in short, to grant universal suffrage to

the proletariat. It marked the arrival, as yet more theoretical than real, of the fourth estate.

But the Girondists, who flattered themselves that they could manage the people just as earlier they had flattered themselves that they could manage the king, perceived to their amazement and irritation that in the aftermath of August 10 the people were turning from them to follow the Montagnards, who had been the true authors of the overthrow of the king and of the emancipation of the peasants. In their declaration of war the Girondists had promised that it would be short and victory rapid. They had nourished illusions regarding the strength of the Declaration of the Rights of Man as a rallying cry. They had predicted that the people in foreign lands would rise against their tyrants at the call and example of the French people. But the foreign people seemed asleep or subdued, and the war prolonged itself endlessly, waxing in its proportions. The rapid fall of the assignat, issued in increasingly large amounts to keep pace with the enormous aggravation of expenses, produced a colossal rise in the prices of all merchandise. The salaried classes began to murmur. The Girondists, committed to commercial liberty, turned a deaf ear to their complaints and rejected the remedies proposed by the Montagnards—remedies borrowed from the interventionist legislation of the *ancien régime*, such as censuses, regulations, requisitions, control of prices, economic and administrative centralization. A vast agitation began, born of suffering and misery. The Girondists fearing the proletariat held out their hands to the reactionaries. They were ready to give pledges. They incited the provinces against Paris, the citadel of the Montagnards. They attempted vainly to save the king as they had tried earlier to save the throne. They brought Marat to the bar. They called in the generals to help them. They overlooked the insubordination and intrigues of a Dumouriez.

The Montagnard minority in the Assembly drew its strength from the communes of the large cities and from the Jacobin clubs, which were rapidly being purged of rival elements. Since the Montagnards had opposed the war the people could not hold them responsible for the grievous economic crisis which it had precipitated. Their social program kept them in close contact with the populace. The defeats of the spring of 1793, the treachery of Dumouriez, the revolt in the Vendée, allowed them at last to assume power. Their *coup de force*, extending from May 31 to June 2, purged the Convention

of their adversaries and was followed up shortly by the organization of a dictatorship—the collective dictatorship of the Committee of Public Safety and the Committee of General Security supported by a Convention which had become provisionally Montagnard in spirit. This event was equivalent to a new revolution—the fourth. The dictatorship of the committees was the dictatorship of the Montagnard party and to a certain extent the dictatorship of the sans-culottes.

This dictatorship, which lasted a little over a year, sprang much less from a preconceived theory than from the immediate necessities of the military situation at home and abroad. The enemy had to be pushed back from the borders, the royalist and Girondist insurrections had to be suppressed. Food had to be supplied to the armies and cities starved by the English blockade. The millions of soldiers that were being shipped off to the frontier had to be clothed. Terror became the order of the day. For the enemies of the regime the guillotine was set up. Elections were suspended. Resistance was beaten down by the medium of *commissaires de la Convention* armed with unlimited power. To the generals went out the order, "Victory or death." In place of liberty authority was enthroned. The Montagnard revolution rested upon principles which had little in common with those of the individualistic revolution. In the name of public safety, as formerly in the name of the king, individual wills were over-ridden and when necessary the rights of property. Necessities of life were communized; provisions and merchandise were requisitioned for the defense of the nation and the revolution. Municipal bakeries and butcher shops were set up. In short, there arose under the pressure of circumstance an embryonic collectivism. The emergency character of the experiment is indicated by the fact that the very ones who were resorting to it considered it as a temporary expedient, all traces of which should be wiped out as rapidly as possible.

The new dictatorship contrasted strikingly with that exercised by the Constituent. The latter had been accepted, even welcomed, while the success of the new was detested or at best condoned. The Constituent was supported by public opinion, which urged it on to more and more severe measures against the enemies of the revolution. Its committees had been obeyed without complaint by the elected authorities, who met its desires. By 1793 a profound change had taken place. The foreign war had its counterpart in civil war. The revolts of the

Vendée and of the federalists, the execution of the king, the military defeats, the requisitions, the misery consequent on inflation, official repudiation of Christianity and the closing of the churches, the regime of the suspects and the overworked guillotine, all these terrifying manifestations of the crisis brought discouragement to large sections of French society and pushed them into the opposition, desirous above all of peace even at the price of the reestablishment of the *ancien régime*.

It was no longer possible to justify the new revolution as Sieyès had the old by the single theory of the *pouvoir constituant*. It was too obvious that it was no longer an application of the sovereignty of the people but rather the exact opposite. Accordingly, in rebutting an attack of the Dantonists Robespierre justified the dictatorship by drawing a fundamental distinction between a state at war and a state at peace, between the constitutional regime and the revolutionary regime. His speeches of 5 Nivôse and 17 Pluviôse expounding this thesis contain the theory of the revolutionary government, which was already an adumbration of the dictatorship of the proletariat. The constitutional regime according to Robespierre is capable of functioning only in time of peace. In time of war it must give way; otherwise it would destroy liberty. "The aim of constitutional government is to preserve the Republic; that of revolutionary government, to establish it. Revolution is the war carried on by liberty against its enemies; constitutionalism, the regime of liberty victorious and at peace." Revolution being essentially civil war, "revolutionary government entails an extraordinary activity for the very reason that it is at war . . . and forced to endlessly deploy new and rapid resources to meet new and pressing dangers." Whereas the theory of constituent power had grounded dictatorship upon the unanimous will of the people, the theory of revolutionary government grounded it upon the political and patriotic necessity growing out of the war. Robespierre admitted the dangers of such a regime. What would become of the state if the dictators should selfishly capitalize their power? There was only one protection, as far as he could see—the moral virtue of the dictators.

The revolutionary groups in France had believed that as soon as they acquired political power they could immediately settle the social question. They perceived quickly enough that they were mistaken. Their work was thwarted by the wealthy classes, who coalescing against

the revolutionary legislation impaired its effectiveness. They did not entertain the idea, however, of recasting their principles. They had no inclination to introduce limitation of property as the normal and abiding foundation of the social order. Private property still seemed to them sacrosanct. They wished only to correct its momentary abuses and they were reduced to this expedient of a revolutionary dictatorship, which they conceived as being provisional. They imagined that it would be sufficient merely to strike terror into the aristocrats, to imprison them, to banish them, and that then the social question—which they continued to regard as a political rather than an ethical question—would be solved. Their attitude is readily understood if it is borne in mind that a good number of them were property owners—well to do bourgeois, lawyers and professional men. The terrorist dictatorship was popular in its aims, but it was carried out by bourgeois.

Only a small minority composed of those who had been taught by experience understood that the maintenance of the *sans-culottes* in power could not be perpetuated except by means of a progressive and lasting limitation of individual property. Robespierre, Saint-Just and Couthon proposed in the laws of Ventôse to turn over the property of the suspects to the poor. But their colleagues turned a deaf ear to the proposition. The Committee of Public Safety had already refused to nationalize the food supply. Carnot had opposed the taking over of manufactures, even of those which had been founded by the representatives on mission. The Committee of General Security, in concert with certain members of the Committee of Public Safety, blocked the laws of Ventôse and their authors were driven from power, 9 Thermidor.

The great majority of the members of the Convention were individualists bitterly opposed to anything that savored of communism. The true communists, those who were convinced that the reign of the fourth estate is possible only on condition of the suppression of individual property, were isolated figures without influence and in the main not looking beyond a communism of provisions and, by implication, of land. When Babeuf attempted in the post-Thermidor period to bring them together into one large party, it was too late. The dictatorship had collapsed and Babeuf was powerless to re-establish it. He paid with his life for his experiment—a belated experiment and at the same time premature; belated because it was advanced

at a time when the Montagnard party had already fallen from power and was already decimated by the Thermidorian proscription; premature because public opinion had not been prepared for communistic ideas.

The revolution of July, 1789, which had brought the bourgeoisie into power, was the child of eighteenth century philosophy, a philosophy liberal and individualistic to its roots. The revolution of June, 1793, which swept the Montagnards into power, was the work of circumstance and necessity. It was not the product of a campaign of education, of a systematic view of government and society or of a penetrating analysis of economic evolution. It could scarcely have been otherwise at a time when machinery was in its infancy and its fatal offspring, industrial concentration, not yet manifest. The most daring of the revolutionary thinkers, Babeuf himself, hardly conceived of communism other than in an agrarian context. The majority of the communists of the time distinguished clearly between industrial property, which they wished to respect as being the product of labor, and landed property, which alone their program affected.

This fact clarifies not only the basic difference between the Jacobin dictatorship and more recent dictatorships but also the fundamental reasons for its frustration. Although the Bolshevik dictatorship is similar to the Jacobin in that it sought justification in the circumstances of war, it at least rested in contradistinction to the latter on the coherent doctrine of Marxism, which it proposed to put into practise. The Bolsheviks had no qualms about destroying either individual property or even the structure of the state which they had usurped. The Jacobins, on the contrary, tampered only timidly and partially with the system set up by the Constituent. They merely superimposed their economic dictatorship on the older individualistic legislation without destroying it. Their requisitions and their taxes did not abolish private property. They merely restricted the use of it. Their communism, which was never more than provisional and relative, was only an expedient. They themselves made apologies for being forced to resort to it.

In the political realm similar differences are apparent. The Russian communists, loyal to the ideology of Marx, have been anxious from the first to transfer power to the proletariat. The government which they have set up is consistently a government by a class. The Montagnard

Jacobins, on the contrary, although they were obliged to lean upon the sans-culottes and to govern in their behalf and in their interests, never really grasped the idea of class. They hounded the royalists, the Feuillants, the Girondists, not as members of a hostile class but as political adversaries and as accomplices of the enemy. This is readily explicable. The Montagnard leaders who sat in the committees and in the Convention were not members of the proletariat but merely its friends and allies. They still clung to eighteenth century philosophy—a philosophy which is the negation of class, which ignores social groups in favor of the individual.

That is why the Montagnards, in contrast to the Bolsheviks with their basic doctrine of class antagonism, remained fundamentally individualistic and never developed a thoroughgoing, organic dictatorship. Lenin and his associates realized that the establishment and perpetuation of the proletarian dictatorship were handicapped by the separation and division of the powers of the state. The Council of the Commissaries of the People legislates and at the same time executes. In France under the Terror it was different. Unity was never entirely realized in the revolutionary government. The Convention, to be sure, was purged. Theoretically it combined the legislative and the executive. But actually the Committee of Public Safety was responsible for the prosecution of the war, for the handling of diplomatic relations and for general administration, while the Committee of General Security directed political policing and the suppression of conspiracy. Thus there was a division of the executive and the legislative power: the Convention on one side, the committees on the other. There was a dualism even in the executive power, which was divided between two separate committees. The revolutionary machine of the Montagnards was infinitely more complicated and its manipulation correspondingly more delicate than the revolutionary machine of Soviet Russia.

With the fall of Robespierre individualism reasserted its rights to the full. The system of requisitions and taxes passed with the Terror. The bourgeoisie after a momentary curtailment of its power sprang up again fully triumphant. The Girondists, freed from prison, resumed their seats in the Convention. The last Montagnards were exterminated in abortive risings. Their agents, who had had the courage to organize and to operate the revolutionary government, were branded with the name of terrorists and disarmed en masse. There is no record of

those who fell, massacred during the white terrors. The proletariat sank again into silence and subjection. If it later welcomed the dictatorship of Bonaparte it was because he gave them work and bread. The revolution by and large had done no more than replace one class with another, an aristocracy of birth with an aristocracy of wealth, but it had flung out to the world the idea of social justice.

The French Revolution succeeded, it would seem, only to the extent that it had been prepared for. The work of the bourgeoisie, it redounded to the profit of the bourgeoisie. This class, possessed of wealth and intellectual superiority, was destined to triumph over a nobility which, despite the significant attempt at rehabilitation undertaken during the last days of the monarchy by the higher ranks, was essentially impoverished and already half dispossessed. It was destined to triumph over the people, because the people, still untrained, was dependent upon it for its leaders. The bourgeoisie alone was endowed with a sufficiently developed class spirit to seize and maintain power.

It is a most striking fact that during this period the artisan classes of France entered the struggle only in a political sense, even when the struggle was directed toward social demands. Corporations were suppressed. Syndicates did not yet exist. The guilds were weakened by division. Strikes were forbidden. It was in the clubs and the popular societies, in the communes and in the sections, that the sans-culottes, thrown in with the advance party of the bourgeoisie, were forced to fight for their interests. They were bent on getting complete control of public power. To get control of the state they did not hesitate to resort to the mobs which were being organized in the political societies and which were achieving results only because the armed force, the national guard, was on their side, as were frequently the communal authorities as well. July 14, for instance, was mapped out by the assembly of electors which had appointed the deputies from Paris to the Estates General, and this assembly of electors sat in the Hôtel de Ville next to the legal municipality. August 10 similarly was the work of the sections and of a part of the commune. The same is true for May 31.

After Thermidor the bourgeoisie once more came into its own. It purged the national guard and soon afterwards disarmed it; the mobs, which no longer had the support of the communal authorities, suffered a succession of failures. The clubs were closed, robbing the famished

and disarmed mobs of a place of meeting and of a *point d'appui*. They drifted helplessly. The situation would have been different if the proletariat of this period instead of borrowing its political organization from the bourgeoisie had succeeded in working out a class organization. But as it was, when the sans-culottes lost political power they lost everything.

The triumph of the bourgeoisie was perhaps too complete. Hounded mercilessly by the *lois d'exception*, the last democrats disappeared or took refuge in surly abstraction. The Thermidorians remained isolated, surrounded by a hostile nation.

The great majority of Frenchmen, surfeited with politics, their spirits broken by the sufferings of war, pined only for peace. They no longer bothered to perform their duties as electors when the suffrage was restored to them. Only the professional was interested in politics. The average Frenchman no longer mentioned public affairs except with irony and disgust. Dictatorship, which under diverse forms had been continuous since 1789 and which was perpetuated by the coups d'état of the Directory, forced the individual to withdraw into himself. Idealism was dead among the royalists as well as among the republicans. Generous enthusiasm gave way to egoism. The time was ripe for Bonaparte with his reassurances and consolidation of interests. In default of political liberty he brought to the French the assurance of civil liberties. In his code he preserved equality, their most cherished possession. He maintained the greater number of the institutions of the revolution, fusing them at times with adaptations made from those of the *ancien régime*. So forceful was his work that the door was forever closed to an integral restoration of the past.

The influence of the French Revolution on France and on Europe was so important that it is no exaggeration to say that it marks the beginning of a new era in the history of the world. France found herself greatly strengthened by the destruction of the *ancien régime*. No other state was so homogeneous. The suppression of orders, of bodies, of privileges, the unification of legislation, the standardization of institutions, the decisive advancement of the national language, had already generated a tremendous *élan*. It was only in France that for a long period of time the all powerful state ruled over citizens endowed with equality.

The individualistic program of the physiocrats was in a large measure realized. The right

French Revolution

of property, recognized as absolute, allowed the French full enjoyment of economic and civil liberties. The road was wide open to the rise of capitalism, and it was not simply a coincidence that the great capitalists were in the majority of cases ardent revolutionaries.

In principle the revolution proclaimed itself peaceful. It solemnly renounced all conquest—a spontaneous gesture which won many sympathizers abroad—but the violent clash of the revolutionary program with the monarchical rendered the maintenance of peace impossible. War changed the aspect of the problem. The kings of neighboring countries were forced to resort more and more to French methods as a war measure. In 1794 the king of Spain inaugurated a confiscation of the church treasury. The following year he appropriated the revenues of vacant ecclesiastical benefices and at the same time began the issue of paper money. The Austrian emperor was reduced to the same necessity. Confronted with a shortage of troops, he resorted in the third year of the war to the device of the *levée en masse*. Pitt kept in power only by loans. Fortunately the crowned heads of Europe did not dare prescribe universal military service, which saved France, because as Mallet du Pan has pointed out they were almost as afraid of their subjects as they were of the enemy.

Victory intoxicated the French. Under the pretext of bringing liberty to their neighbors they brought conquest in the form of a rejuvenation of the old theory of natural frontiers. They became a perilous threat to the liberty of Europe. Napoleonic militarism brought into being nations which had hitherto had no national consciousness. Thus the nationalistic struggles so numerous in the nineteenth century were the direct offspring of the French Revolution. In the past, wars had been purely dynastic; the people had played but a passive role. The wars of the future in direct contrast were to put into the field larger and larger armies recruited according to the French system of military service extended progressively to the entire nation. In 1793 France had equipped 1,200,000 men. It was the first time since antiquity that an equal number of effectives had been assembled together. Never had there been recruited an army equally nationalistic in spirit, which went out not only to defend its national independence but to impose on others its political and religious credo.

With the progress of the nineteenth century the struggles between peoples became increas-

ingly bitter. Europe was split up into hostile nationalistic systems. But early in the century conditions were different. The conflict was as yet more social than political. In all nations there were minorities of varying strength, which shared the French ideal and more or less secretly expressed their wishes for its success. In order to prevent these minorities from expanding and contaminating the rest of the subjects, monarchs were forced to grant increasingly important concessions. Thus the efflorescence of nationalism was accompanied by a liberal movement which gradually undermined the walls of France's neighbor states. Moreover, both nationalists and liberals belonged to the same social class—to that enlightened bourgeoisie which had reformed France and subsequently become the model for Europe.

At the outset the revolutionaries in France although tinged with the spirit of Voltaire had nourished little hatred against the church and still less against religion. They dreamed, on the contrary, of securing the collaboration of the clergy in the defense of their political work. Their union with the lower clergy had been very close. But the refusal of the pope to ratify their religious reforms, the schism within the clergy, which was divided into juring and non-juring priests, their ineffective efforts to repair this schism—all of these factors led them gradually to a policy of hostility toward the church. They wound up by secularizing the republic through the separation of church and state. The Concordat of Bonaparte, designed primarily to reassure the classes which had acquired national property during the revolution, was powerless to reestablish the former close alliance between throne and altar. The civil state remained in the hands of civil magistrates. Anticlericalism, which before 1789 was nothing more than a point of view, became a program which was to be adopted by the majority of liberals throughout Europe.

Similarly the divine right of kings had received a fatal blow in the proclamation of the principles of 1789. The idea of sovereignty had undergone a change of meaning. From the king it had passed to the people, and the scaffold of January 21 had shorn it of all supernatural prestige. When Charles X at his coronation made for the last time the gesture of touching the scrofulitic he was greeted with laughter.

The American Revolution had been primarily a political revolution. It had respected the privileges of the wealthy classes and had established without exception an electoral system based on

the census. It had not even struck at the remnants of the feudal system which here and there were still in evidence. The seigniorial rents in the state of New York, for example, were not suppressed until the middle of the nineteenth century.

The French Revolution was profound in a different sense. It thoroughly exterminated without indemnification feudal dues and the *dîme*. It nationalized the property of the church and the property of the émigrés. It completely remodeled the commercial industrial regime. It revealed itself almost from the beginning as imbued with a keen sense of equality, which reached its apogee in 1793–94. Under the stress of necessity rather than theory a social democracy made its début and attempted to take its place in the world of men. The attempt was premature and failed. But it did not disappear without leaving traces, at least in the realm of ideas. The de facto collectivism realized by the terrorist regime, the control of prices, the requisitions, the communizing of all the resources of the nation, were cited over and over again by the social reformers during the century after Babeuf.

If the Terror continued to freeze the blood of nineteenth century bourgeois it kept alive the hope of champions of social justice. It acted upon their imaginations like a grandiose myth, a breeder of devotion and sacrifice. The historian Gabriel Monod in his preface to Mathiez' *Contributions à l'histoire religieuse de la Révolution* recounts that at Nantes toward the middle of the last century the woman at whose house he was boarding was singing the praises of her father, who had enthusiastically welcomed the revolution and had fought for it in his youth against the Vendéans. "He sorrowfully witnessed the extermination by the imperial regime of the democratic liberties which had been bought so dearly. At each new revolution—1814, 1830, 1848—he had believed that the ideal republic, dreamed of in 1793, was about to reappear. He died under the Second Empire, more than ninety years old; at the moment of death, raising his eyes ecstatically toward the sky, he murmured, 'O sun of '93, I shall then die without having again seen thy rays!'" He was no exception, this old Breton. The sun of '93 which had illumined his youth had ill succeeded in cloaking itself behind the darkened horizon, for in his heart he had kept bright its undying rays.

Mankind has need, in the course of its trying and discouraging march forward, to have its illusions rekindled by the warm rays of the past.

The revolutionaries of 1789 drew sustenance for their struggles from the memory of the republics of antiquity or from the more recent example of the American Revolution. Plutarch was before their minds and his spiritual elevation served to exalt their courage, to increase their faith in the revolution. They imitated the heroes of Greece and Rome and like them gave up their lives for their faith—becoming in their turn heroes. For their descendants they became what Aristides, Brutus and Cato had been to them—martyrs who by their lives and their deaths bear witness to the abiding strength of devotion to justice and selfless love of humanity. The republicans of France have faithfully nourished their memory, and the revolution has served in contemporary history as a spring, ever fresh, of precedent and inspiration.

FRENEAU, PHILIP MORIN (1752-1832), American poet and editor. Graduating from Princeton when it was a hotbed of radical Whig ideas and caught up in the revolutionary movement, Freneau employed his poetic talents in celebrating the exploits of the patriot armies, heartening the American public and lampooning the British. Particularly after his release from a British prison ship in 1780 he poured out a flood of verse dealing with every phase of the war and driving home the doctrines of the revolutionary leaders. Continuing to write political satires and joining the anti-Federalists, he attracted the attention of Madison. The latter in 1791 made an arrangement with Jefferson's aid by which Freneau received the post of translating clerk in the State Department with the understanding that he should launch an anti-Federalist newspaper. The resulting organ, the *National Gazette*, undertook not only "the chastisement of the aristocratical and monarchical writers" but the criticism of Washington's administration and particularly of Hamilton's share in it. Freneau dealt vigorously with the government's neutrality policy, defended the operations of Genet and harshly attacked Hamilton's financial measures. He assailed the extension of federal powers under the "general welfare" clause of the constitution as a dangerous move toward centralization and denounced the supposed monarchical tendencies of both Hamilton and John Adams. In October, 1793, the *National Gazette* ceased publication. Freneau continued his contributions to the press and in 1795 established the *Jersey Chronicle*, followed two years later by the *Time-Piece and Literary Companion*. These continued to disseminate the ideas of Jefferson, Paine and Rousseau and to exalt libertarian and egalitarian ideas at the expense of aristocracy and centralized efficiency. Although the *Time-Piece* was short lived, Freneau's use in it of

poems, skits, dialogues and epigrams was a notable contribution to journalism. Retiring to his New Jersey farm in 1807 he ceased to write; but before he died his poems went through five editions.

FREQUENCY DISTRIBUTION. Like many terms in statistics frequency distribution is used in a dual sense: it refers both to a finite collection of phenomena of the same general type but varying from case to case, which are tabulated and arranged in groups, and to the properties of the objective reality which give rise to such phenomena. These two notions, whose contrast has been so little emphasized that much confusion has resulted, are often described by the terms "sample" and "hypothetical infinite population." This terminology brings out the analogy with the simpler but rarer operation of sampling from a limited population for the sake of finding out something about this limited population only, not as an indication of broader tendencies. In more scientific studies any available data, even the complete record for a whole nation, are regarded as a mere "sample" of what the underlying forces might produce; and these underlying forces, with the further samples to which they may give rise, constitute the real goal of investigation. The infinite character of the hypothetical population is merely an expression of independence among the members of a sample; in a finite population, for example of colored balls in a bag, the constitution would vary in the course of the sampling by reason of the removal of some of the balls.

The concept of a frequency distribution as a property of a set of conditions is identical with that of mathematical probability as applied either to discrete classes or to one or more continuous variables. Two types of problem occur: the direct problem of finding the probability of a particular type of sample when the population is fully specified, and the inverse problem of inferring a population from a sample. While the solution of a direct problem is fully determinate and may be worked out by a competent mathematician

accurately on the basis of unquestioned principles, inverse problems can be solved only on the basis of assumptions or criteria upon which no universal agreement has yet been reached, and which possibly vary from one problem to the next. The discussion of these criteria constitutes the theory of statistical estimation, to which the chief contributions have been made by R. A. Fisher.

The type of frequency distribution of chief interest is that of a single, sensibly continuous variable. To investigate such a variable a number of observations are collected and arranged in the order of values which the variable assumes in each observation. It is useful to divide the range of the variable into definite classes, taking particular care to adopt a convention as to the disposition of marginal and otherwise doubtful cases. Thus when an observation falls exactly on the boundary between two classes, each of these classes may be credited with one half, giving rise to fractional frequencies. A list of the number of observations falling into each class may then be prepared; the result is a frequency distribution in the sense of a sample. An illustration of such a frequency distribution is presented below.

GROSS PROFIT MARGINS IN RETAIL HARD-WARE STORES

CLASS INTERVAL (in percent)	NUMBER OF CASES
Less than 4	3
4 to 8	10
8 to 12	16
12 to 16	30
16 to 20	20.5
20 to 24	15.5
24 to 28	5
Over 28	—
Total	100

A frequency distribution of this sort may be treated graphically by measuring the continuous variable horizontally and constructing rectangles with areas proportional to the frequencies, yielding a block diagram, or histogram. If the class intervals are of unequal length it is important to observe that it is the areas and not the heights of the rectangles which are proportional to the frequencies. The frequencies are often graphed as the ordinates of points which are connected by a broken line; this type of figure is perhaps simpler and smoother but leads to confusion when the class intervals are unequal.

A cumulative frequency distribution gives the number or sometimes the proportion of cases for which the variate takes a smaller value than

each value considered. It may be obtained from an ordinary frequency distribution by writing down the first frequency, then the sum of the first two, then that of the first three and so on. The graph of a cumulative frequency distribution is called an ogive. It rises continually, or at least never falls, in passing to the right.

In the foregoing illustration the frequencies in the extreme classes are small, and as a central value is approached from either side the frequencies in the class intervals gradually increase. This is typical of nearly all frequency distributions and for a good reason. The variable is generally affected by a large number of more or less independent causes, some accidental circumstances tending to increase its value, others to decrease it. The effect of each of these varying causes may be very slight. In order that the variable may have an extremely large or small value it is necessary that a large number of these fluctuating conditions shall concur in influencing it in the same direction, and this will seldom happen.

If the class intervals chosen are so short as to produce only small frequencies in each class, the truly continuous and single peaked nature of the frequency distribution may be masked by the irregular fluctuations associated with the small frequencies. On the other hand, excessively long class intervals are to be avoided because of the loss of information when the position within the group is unknown. The larger the sample, the finer becomes the appropriate grouping. The frequency distribution of the population may be depicted by a continuous curve, which may be regarded as the limit of the histogram when the size of the sample is increased and the grouping simultaneously made finer.

The problem of statistical estimation becomes in this leading case the problem of frequency curve fitting. Such fitting may be done either by free hand drawing or by assigning definite values to the constants of some analytic equation. The curve fitted by free hand drawing should have as few sharp turns as possible and should enclose the same area as the graph of the observations. Much is to be said for this method, particularly in the early stages of an investigation. Indeed, the importance of continual ready resort to graphic methods throughout a statistical study cannot be overstressed. When an analytic curve or equation is to be fitted, the procedure falls into three parts: the selection of a type of equation, which will involve disposable constants or parameters; the assignment to these

parameters of values dependent on the data with a view to obtaining a fit which on some criterion will be as good as possible; and the testing of goodness of fit, or of agreement of observation with hypothesis.

Of the types of frequency curves which have been proposed, those of paramount importance are the Gram-Charlier series and the system of Karl Pearson. The former is an infinite series, of which the first term is the ordinate of a normal distribution, $y = \frac{1}{\sigma\sqrt{2\pi}} e^{-\frac{(x-m)^2}{2\sigma^2}}$,

multiplied by a constant, and the later terms are the derivatives of the first with respect to x , also multiplied by disposable constants. Only the first few terms of the series are used, their number depending on the number of constants which can be evaluated dependably by means of the data at hand. For distributions far removed from the normal form the convergence is slow, and the sum of the first few terms may give negative frequencies, which are inadmissible.

Pearson proposed the use of frequency curves obtained from the following differential equation: $dy/dx = y(x+a)/(b_0 + b_1x + b_2x^2)$. These curves have each a single maximum, for which $x = -a$, since the tangent becomes horizontal only here and at the ends of the range, where $y = 0$. The form of the curve depends on the values of the constants, particularly on the real or imaginary nature of the factors of the denominator. The constant of integration is determined in fixing the area under the curve, leaving four parameters upon which depend the location, dispersion and shape of the curve. There are, however, certain transitional types involving fewer than four constants. The normal distribution mentioned above is one of these transitional types, having two parameters, m and σ . A transitional form having three parameters is Type III, which may be written as follows:

$$= \frac{1}{p!a} \left(\frac{x-m}{a} \right)^p e^{-\frac{x-m}{a}}$$

In addition to continuous curves many methods of smoothing data are in use, particularly among actuaries, which replace observed by theoretical frequencies in the classes originally adopted, without providing analytic equations. A considerable number of these have been described by Whittaker and Robinson. A method of difference equation graduation has been devised by H. C. Carver (in the *Handbook of Mathematical Statistics*, ch. vii).

Other types of frequency curves may be derived from the Bernoulli, or binomial, distribution, which is a discrete distribution arising directly from theory. If in independent trials, such as the tossing of a die or the spinning of a roulette wheel, the probability at each trial of a particular type of outcome, which may be called a "success," is p , then the probability of x successes in n trials is $[n!/x!(n-x)!] p^x(1-p)^{n-x}$. When the number of trials increases indefinitely, the binomial distribution approaches the normal form in the sense that, putting $t = (x - np)/\sqrt{np(1-p)}$, the probability that t lies between t_1 and t_2 approaches

$$\frac{1}{\sqrt{2\pi}} \int_{t_1}^{t_2} e^{-\frac{t^2}{2}} dt.$$

The significance of t will become clearer if it is realized that in a binomial distribution the mean value (corresponding to m in the equation of the normal curve above) equals np and the standard deviation equals $\sqrt{np(1-p)}$. This expression for the probability integral, usually ascribed to Laplace or Gauss, seems to have been obtained by A. de Moivre in 1733.

Another limiting form of the binomial distribution arises when there are many opportunities for a very improbable event to occur. If p approaches zero at the same time that n increases, in such a way that their product retains a fixed value m , the successive terms of the binomial approach e^{-m} , me^{-m} , $m^2e^{-m}/2!$, . . . This is the Poisson distribution. A soldier is not likely to be killed in a given year by the kick of a horse, but there are many soldiers in an army corps; consequently Bortkiewicz was able to show that ten Prussian army corps, whose records for twenty years constituted 200 trials, supplied for the numbers 0, 1, 2, 3 and 4 of soldiers killed in this way frequencies approximately proportional to the terms of a Poisson distribution (*Das Gesetz der kleinen Zahlen*, Leipsic 1898).

The normal distribution, often called the Gaussian law of error, will be approximated by a variable which is a linear function of a large number of independent quantities, all making approximately equal contributions to its variation. It is this property which gives the normal distribution its chief importance, since most frequency distributions encountered in practise represent the resultants of large numbers of more or less independent causes. Extensions of the derivation of the normal distribution to cases in which the contributory variables are not entirely independent have been discussed by the

Russian mathematicians A. Markov, S. Bernstein ("Sur l'extension du théorème limite du calcul des probabilités aux sommes de quantités dépendantes" in *Mathematische Annalen*, vol. xcvi, 1926-27, p. 1-59), and others.

The wide use of the normal distribution in statistics rests upon its property as the limit of the distribution of a linear function of many variables as well as upon considerations of convenience in mathematical operations. It is particularly to be noted that the arithmetic mean is a linear function, and that consequently the mean of a number of values from any distribution will usually have a distribution more nearly normal than the original. Hence the mean of the squares or of the powers of any order of n random values of an arbitrary variable will have a distribution very close to the normal form when n is large.

When the type of distribution to be fitted to empirical data has been chosen, the determination of the parameters presents the next problem. The method of fitting advocated by Karl Pearson for his curves, which was also adopted by the Scandinavian mathematicians who developed the Gram-Charlier series, is the method of moments. This term, like frequency distribution, is used in a dual sense. The k th moment of a sample is the arithmetic mean of the k th powers of the observed values. The k th moment of a hypothetical infinite population is the mathematical expectation of the k th power of the variable studied; that is, the sum or integral of the products of the probabilities of particular values by the k th powers of these values. In determining, say, four parameters the method of moments consists in equating the moments of orders 1, 2, 3 and 4 of the sample to the corresponding moments of the theoretical population, thus obtaining four equations for evaluating the four unknowns. Since the distribution of means is likely to be much closer to the normal than the original distribution, the distribution of sample moments is for large samples approximately normal. Hence the probable error of a moment may be given the usual interpretation of a probable error, provided the sample is moderately large.

R. A. Fisher has proposed the method of maximum likelihood for fitting curves. The concept underlying this method is that of the likelihood of a particular set of values of the parameters of the infinite population on the basis of the given sample. It is defined by Fisher as any quantity proportional to the probability of ob-

taining exactly the sample which has been obtained on the assumption that the values which have been assigned to the parameters are the true ones. Likelihood is a measure of degree of rational belief but is distinct from mathematical probability and is not subject to its laws. In particular, likelihood is not to be multiplied by the differential of the parameter and integrated, as has been done with inverse probability.

For determining the mean m and variance σ^2 of a normal distribution the method of moments and the method of maximum likelihood give the same result. In other cases the estimate obtained by maximum likelihood has a smaller probable error than that by moments. For determining the parameter m which fixes the location of a Pearson Type III curve, for example, the variance is $a^2(p - 1)/n$ when the method of maximum likelihood is used with a sample of a large number of observations and $a^2(p + 1)/n$ when the method of moments is used. Thus increased accuracy, which is measured by diminished variance, may be obtained either by increasing the size of the sample when the method of moments is used or by resorting to the more accurate method of calculation by the method of maximum likelihood. In fitting a Type III curve for which $p = 2$, for example, a degree of accuracy in location obtainable by the method of maximum likelihood with 100 cases requires 300 cases when the method of moments is used. Against this advantage must be set a greater labor in calculation, since the equations are not, like those involving moments, linear.

In connection with the method of maximum likelihood Fisher developed the concept of the efficiency of a method of curve fitting—the extent of utilization of the total information in the sample regarding the value of the parameter—and of the amount of information in the sample relevant to the value of the parameter. Efficiency is measured by the ratio of variances of the values of a parameter obtained by different methods. Fisher has given a proof, applicable in the limit to large samples, that if the optimum estimate (i.e. that obtained by maximum likelihood) has a normal distribution, its variance is less than that of any other normally distributed estimate of the same parameter. It appears likely that with increasing size of sample the distribution of optimum estimates approaches normality for a rather wide class of parameters (see Hotelling, Harold, "The Consistency and Ultimate Distribution of Optimum Statistics" in American Mathematical Society, *Transactions*, vol.

xxxii, 1930, p. 847–59). In such cases the method of maximum likelihood has the maximum possible efficiency. The amount of information is measured by the mathematical expectation of $(\delta L/\delta m)^2$, where L denotes the logarithm of the likelihood and m the parameter. In a considerable class of cases the reciprocal of this expectation approximates for large samples the variance of the optimum estimate.

The propositions regarding the efficiency and amount of information of the method of maximum likelihood have not been proved valid except in the limit for large samples, and even there the proofs are possibly vulnerable from the standpoint of strict mathematical rigor. How far the theorems are dependable in dealing with small samples is still a matter of guesswork. Moreover, for the location of discontinuous distributions the theorems on maximum likelihood are not applicable. Nevertheless, a review of the proofs which have been given suggests strongly that for the samples ordinarily dealt with the method of maximum likelihood has a marked advantage in accuracy. The method is applicable not only to the fitting of continuous curves but also to discontinuous distributions of many sorts and to the joint distributions of several variables.

After values have been assigned to parameters the goodness of fit must be tested. The best known method of testing is that devised by Pearson. Consider a population with a grouping into k classes, with probabilities p_1, p_2, \dots, p_k of an individual falling into the several classes. For a sample of N the most probable numbers to be expected are Np_1, Np_2, \dots, Np_k ; let these expected numbers be denoted by m_1, m_2, \dots, m_k . If in an actual sample of N the numbers observed to fall into the several classes are m_1', m_2', \dots, m_k' , an appropriate measure of the

total discrepancy is $\chi^2 = \sum_{i=1}^k \frac{(m_i' - m_i)^2}{m_i}$.

Pearson showed that if the frequencies in all classes are large enough to permit the replacement of the binomial by the normal distribution, the probability of any value χ being exceeded by chance is

$$P = \frac{\int_{\chi}^{\infty} \chi^{n-1} e^{-\frac{1}{2}\chi^2} d\chi}{\int_0^{\infty} \chi^{n-1} e^{-\frac{1}{2}\chi^2} d\chi},$$

where $n = k - 1$. As χ increases P declines. When P is very small the frequency curve fitted must be rejected.

Encyclopaedia of the Social Sciences

This method directly applies only to the relatively unusual cases in which the exact proportions among the expected numbers in the several classes are specified completely on the basis of a theory which does not depend at all upon the sample. Commonly there are disposable constants, and the "expected" frequencies are therefore to some extent dependent upon the observations. R. A. Fisher has shown that the χ^2 test is applicable in this case, at least as an approximation, but that the value of n must be diminished by the number of constants determined from the data. Thus if a normal distribution is fitted to the table of profit percentages of retail hardware stores given above, which has 8 classes, the value of n to be used in finding P is 5; for the normal distribution involves as parameters the mean and the standard deviation in addition to the total number N , and all three of these quantities are determined from the observations.

In this modified form the χ^2 test may be applied to a great variety of problems, including that of testing whether two samples grouped in a particular manner may reasonably be considered to have been drawn from the same unspecified population. In this connection a contingency table is used; that is, an array in rows and columns of cells in which observed frequencies are entered. The division into rows represents a classification according to one property and that into columns according to another. If the two modes of classification are independent, the probability of falling into any cell is the product of a number pertaining to its row by a number pertaining to its column. When the observed marginal totals are distributed among the cells in a proportional manner, the result is a set of hypothetical frequencies which may be compared with the actually observed frequencies by means of χ^2 to test the hypothesis of independence. If there are r rows and c columns, the number of degrees of freedom, or n , to be used is $(r - 1)(c - 1)$. In general n is to be taken as the number of cells which can be filled in arbitrarily without conflicting with the marginal totals. A particularly important case is the double dichotomy into a fourfold table. Thus if persons are classified roughly as rich or poor and also as black or white, the numbers in an observed sample may be represented in a table of the following form:

	Rich	Poor
White	a	b
Black	c	d

χ^2 in this case may be shown algebraically to

$$\text{have the value } \frac{(ad + bc)^2 (a + b + c + d)}{(a + b)(c + d)(a + c)(b + d)},$$

where a , b , c and d stand for the observed frequencies. Since only one cell may be filled in arbitrarily without conflicting with the marginal totals, the value used for n is 1. Lexis' method for testing homogeneity among different districts of sex ratio of births and similar variables is really a special case of the use of contingency tables. An immense variety of comparisons important in the social sciences may be made in this way.

Apart from the general problem of testing the goodness of fit of a frequency curve, it is of constant importance to compare samples with each other and with theory in particular respects corresponding to the values of particular parameters of distributions. Chief among these comparisons is that of central values, of which the arithmetic mean is the most important for normal distributions. For the arithmetic mean of a sample x_1, \dots, x_N from a normal distribution the variance is that of the population, divided by N . Since the variance of the population is usually not known, it is estimated from the sample by the expression $\Sigma (x_i - \bar{x})^2 / (N - 1)$, where \bar{x} is the mean of the sample. The possible deviation of \bar{x} from the true mean of the population accounts for the use of $N - 1$ instead of N in the denominator. To test the significance of the deviation of the mean from a hypothetical value this deviation is divided by the estimated standard error of the mean (square root of the variance); if the sample is very large, the result of this division may be considered approximately normal in distribution, and tables of the normal probability integral applied. But for small samples this would be inaccurate; the correct distribution was discovered in 1908 by "Student" and proved rigorously correct by Fisher, who has shown how the use of Student's distribution may be extended to a large variety of other statistical tests, including the comparison of two sample means and of least square solutions.

Measures of dispersion are second in importance to those of central value. That most commonly used is the standard deviation, whose square, the variance, may be estimated by means of the preceding formula. Very often N is used instead of $N - 1$ in the denominator, but this tends to bias the estimate in the direction of making it too small. Other common measures of dispersion are the mean deviation, the arithmetic mean of the absolute values of the devia-

tions from the mean, and the semi-interquartile deviation. The last is defined by means of the quartiles—the values of the variable, of which one is just greater than the least fourth of the cases and the other is just less than the largest fourth.

FRÉRET, NICOLAS (1688–1749), French historian. Fréret was a pupil of Rollin and protégé of the count of Boulainvilliers. He was made a member of the Académie des Inscriptions in 1714; he published most of his works in the proceedings of this society and became its permanent secretary in 1743. His studies, the importance of which was not recognized during the first part of the nineteenth century, anticipated the results reached by the scholarship of recent times. His first memoir, *De l'origine des français* (1714), in which he developed the view that the Franks penetrated into Gaul through peaceful agreements with the emperors rather than through conquest, is very similar to the theory later made famous by Fustel de Coulanges. He devoted a large number of works to ancient chronology and to the metrology and geography of the ancient world. He founded the scientific study of mythology, basing it on a comparative and systematic study of the stages through which the various myths passed before they were recorded by historians. With the aid of Galland and especially of manuscript works of the Jesuits he even ventured to study the language, chronology and poetry of the Chinese. His last works treated of the most ancient peoples of Europe and their migrations; he endeavored to make use of linguistics and possibly glimpsed the unity of the Indo-European languages. Fréret almost entirely neglected epigraphy and archaeology but his works are remarkable for their display of vast erudition, for the careful chronological classification of sources and for the emphasis upon the scientific study of origins.

He would have contributed more to the progress of ancient history if his work had not remained in part unpublished; even today the Académie des Inscriptions possesses unpublished memoirs of Fréret. His memory suffered through a singular fraud: philosophers (the real culprit appears to have been Naigeon) issued under his name from 1766 to 1776 some anti-Christian works which gave him a posthumous celebrity he had not desired.

ANDRÉ PIGANJOL

Works: *Oeuvres complètes*, ed. by N. LeClerc de Septchènes, 20 vols. (new ed. Paris 1799), incomplete and containing some apocryphal works; *Oeuvres complètes*, ed. by J. J. Champollion-Figeac, of which only one volume was published (Paris 1825).

P. de, in Académie des Inscriptions et Belles-Lettres, *Histoire*, vol. xxiii (1756) 314–37; Maury, L. F. A., *Les académies d'autrefois: l'ancienne Académie des Inscriptions et Belles-Lettres* (2nd ed. Paris 1864); Flint, R., *Historical Philosophy in France and French Belgium and Switzerland* (New York 1894) p. 246–49.

FRÉRON, ÉLIE CATHERINE (1718–76), French journalist. Fréron was born at Quimper of a humble family of goldsmiths and was educated at the Collège Louis-le-Grand. For a time he taught in the same school until literary ambitions impelled him to abandon both the priesthood and teaching. He became a journalist, published various studies in Abbé Desfontaine's collection and eventually launched a literary review which from 1754 on was known as the *Année littéraire*. Not only was the *Année littéraire* from 1754 until Fréron's death the most vigorous and best written review of its kind in France but it became the prototype of French literary journalism and inaugurated the modern type of French literary criticism. In a century avid for gossip and anecdote Fréron had the courage to introduce a journal serious in approach and encyclopaedic in the breadth of its interests. This journal he used as a medium for the defense of traditionalist ideas against the *philosophes* and the *encyclopédistes*. Voltaire was the particular victim of his attack; and for years the two engaged in polemics in which the great poet seems to have displayed less dignity than his adversary. In general a reactionary, "respecting religion, morality, the state and his superiors," Fréron was not entirely lacking in constructive ideas. He conceived of a social and political reform which should consist not in

extending high powers to selected members of the bourgeoisie—as the *encyclopédistes* would have wished—but in ameliorating the condition of the artisan and peasant classes. Education, redistribution of taxes, abolition of the *corvée* and of internal customs, improvement and freedom of the arteries of communication, removal of the tyranny of the guilds, were elements in his program. After 1765 Fréron's success suffered a gradual eclipse. When in 1776 the government finally acceded to the persistent entreaties of his enemies and suspended his review the blow killed him within a few hours.

His only son, Stanislas-Louis-Marie (1754–1802), politician and journalist, left the Collège Louis-le-Grand six months after his father's death and continued the *Année littéraire* for several years. In 1789 he suddenly assumed the attitude of a violent revolutionist. In May of the following year he founded the *Orateur du peuple* (1790–92; 1794–95), one of the most extreme revolutionary newspapers ever to appear in France. Fréron, who introduced the use of headlines, had journalistic talents of the first order. He possessed to a high degree the art of inflaming the masses, but with this he failed to combine either any real sympathy for them or any rational program for their relief. His political record is one of opportunistic vacillation. In the *Orateur du peuple* he was one of the first to attack the king and as a member of the Mountain he conducted with Barras a terrorist campaign of unexcelled violence in Toulon and Marseille; returning to Paris in January of 1794 he joined the anti-Robespierrists and helped to organize the events of the tenth of Thermidor, after which he appeared as a moderate and a leader of the *jeunesse dorée*. Eventually he offered his allegiance to Napoleon, who in order to be rid of him sent him as subprefect to San Domingo, where he soon died.

FREYCINET, CHARLES DE (1828–1923), French statesman. During the war of 1870 Freycinet's aid was enlisted by Gambetta in the organization of the national defense, but his political career really began in 1876 with his

election as senator from Paris. As minister of public works in 1877 he carried through the Freycinet plan, which created a state system of canals and harbors to serve the entire country and of railroads for the less developed districts of western France to supplement the systems of private companies. This program, subsidized by the state on the one hand and the local departments and communes on the other, was brought to a successful conclusion. Freycinet now became minister of foreign affairs and devoted himself to the solution of two important problems, the relations with Great Britain in connection with Egypt and the relations with Russia. He attempted in various ways to bring about England's evacuation of Egypt but without success. Disturbed by Bismarck's resignation and the possible schemes of William II, he made secret overtures to Russia and finally in 1890 and 1891 concluded with it an alliance, which he strengthened three years later by a defensive military convention between the two countries. Meanwhile Freycinet had become minister of war, which post he held from 1888 to 1893. He put through the military law of 1889, which reduced the barrack service for the active army from five years to three. Besides the active army he developed the reserves, which formed distinct regiments, and completely organized the headquarters staff. Freycinet was four times president of the council—in 1879, 1882, 1886 and 1890. His candidature for the presidency of the republic in 1887 was unsuccessful. Although after 1893 he became less and less active because of his age, he still remained chairman of the army committee in the Senate and became minister again for a short time during the World War. Freycinet wielded great power in parliament: his ability as a speaker, his uprightness, his capacity for work, his organizing genius, made him a statesman of the first rank, although he has at times been reproached for a lack of energy.

GEORGES WEILL

Consult: Schefer, C., *D'une guerre à l'autre* (Paris 1920) p. 74–97, 128–75; *Der Nationalismus im Leben der dritten Republik*, ed. by J. Kühn (Berlin 1920) p. 22–38; Welschinger, H., "Les souvenirs de M. de Freycinet" in *Revue des deux mondes*, vol. xxii (1914) 313–41.

FREYTAG, GUSTAV (1816–95), German historian and litterateur. Freytag was born in Silesia and began his career as a poet and dramatist.

The Revlution of 1848 turned his attention to politics and in July of that year he assumed with Julian Schmidt the direction of the *Grenzboten*, which became the leading liberal journal in Germany. In 1870 Freytag severed his connections with this paper and until 1873 contributed regularly to *Im neuen Reich*. Although between 1848 and 1870 he was one of the leaders of the German liberals his parliamentary career was limited to but one term as a member of the Reichstag of the North German Confederation in 1867.

In the development of German nationalist ideology Freytag occupies a place midway between the humanitarian and cultural nationalism of Herder and the realistic political nationalism of Bismarck. He had a clearly defined concept of nationality as an organic unit with common language, traditions and customs and possessed of a folk character which remains fairly constant and continuous throughout the ages. The bourgeoisie, however, is the mainstay of the national state; it is its most healthy element and the bearer of all progress, culture and civilization. In his dramatic work, *Die Journalisten* (Leipsic 1854), concerned with the life of the bourgeois journalists, in his *Soll und Haben* (3 vols., Leipsic 1855), concerned with the merchant class, and in his *Die verlorene Handschrift* (3 vols., Leipsic 1864), dealing with the learned classes, Freytag extolled the virtues and made himself the champion of the German bourgeoisie. It was this essentially middle class liberalism which made him a bitter opponent of the reactionary absolutist tendencies of the nobility on the one hand and the radical democratic tendencies of the revolutionary tradition on the other. He was a strong advocate of German unification under the hegemony of Prussia with the exclusion of Austria and made this the corner stone of the program of the *Grenzboten*. His deep seated liberalism, however, led him to oppose the policies of Bismarck in both Prussia and the empire.

As a historian Freytag is most famous for his *Bilder aus der deutschen Vergangenheit* (4 vols., Leipsic 1859-67). It is one of the most important of the earlier types of *Kulturgeschichte* and aims at giving an intimate picture of German social and cultural development from the earliest times to Freytag's own day. The popular style of this book with its nationalist coloring gave it a tremendous appeal and made it one of the most popular household books in Germany.

FRICK, HENRY CLAY (1849-1919), American capitalist. Frick correctly estimated the importance of the coking process, started a small coke business, which expanded rapidly, and early set out to secure strategically located coal lands. He was aided by funds from his mother's family, the Overholts, who were prominent distillers, as well as by extensive borrowings, especially from the Mellon bank of Pittsburgh.

During the panic of 1873 he bought the interests of distressed partners and competitors. The much expanded and reorganized H. C. Frick Coke Company improved its already favorable position by the sale of its majority stock to the Carnegie interests in 1882-83. Except for a period of six months in 1887 Frick continued as manager of the coke company until in January, 1889, he was taken into full partnership with Andrew Carnegie as chairman of Carnegie Brothers and Company (later the Carnegie Steel Company).

Frick was instrumental in establishing the anti-union policy of the Carnegie partners. In 1890 he annihilated the union in the coke fields and in 1892 with Carnegie's approval directed the anti-union policy which brought on open warfare at Homestead. This strike started on July 1, 1892. Six days later 300 imported Pinkerton detectives, brought up the Ohio on barges, clashed with the unionists. After a bloody battle the detectives were escorted from town. On July 23, Alexander Berkman, an anarchist, attempted unsuccessfully to assassinate Frick. By fall hunger, dissension and the repressive action of about 8000 Pennsylvania guardsmen had broken the strike.

Expansion of the Carnegie holdings was rapid under Frick's policy of integration, the company acquiring plants, large ore deposits in the Mesabi Range and essential transportation lines, often in spite of Carnegie's objections. Frequent personal disputes between Frick and Carnegie came to a climax in 1899 with the latter's forced resignation and bitter litigation. A compromise agreement gave Frick about \$31,000,000 of stock and bonds in the newly organized Carnegie

company. In 1901 this company was taken into the United States Steel Corporation, of which Frick became a director. Business ventures with Andrew Mellon, large railway investments and participation in the International Banking Corporation were the chief features in Frick's later life. At his death most of his fortune of \$50,000,000 went to art museums and for other public uses.

FRIED, ALFRED HERMANN (1864-1921), Austrian pacifist. Fried was the son of an Austrian radical and an Italian countess. He studied philosophy, practised law and held a post in the Austrian diplomatic service. In more than seventy pamphlets and books and two thousand newspaper articles he enthusiastically advocated international peace, warned of the approach of a world war as the result of international anarchy and reproached European intellectuals for their militarism and nationalism. From 1899 on he worked chiefly through his monthly, the *Friedenswarte*, published in Leipsic until 1914, when he transferred it to Zurich as the *Blätter für internationale Verständigung und zwischenstaatliche Organisation*. In 1912 he published a book (*Der Kaiser und der Weltfrieden*, Berlin 1910, 2nd ed. Zurich 1918; English translation London 1912) which condemned the mutual suspiciousness of European diplomats and argued that the kaiser had only pacific intentions. In 1920 he attacked the forced peace of Versailles in *Der Weltprotest gegen den Versailler Frieden*. He strongly influenced the study of international law in Germany and such scholars as Heinrich Lammasch, Walther Schücking and Hans Wehberg. He sought to secure peace through organization; starting from ethical conceptions he contributed to the development of pacifist thought with his advocacy of international judicial organization depending upon increasingly perfect international cooperation based on economic realities. In 1911 he was awarded the Nobel Peace Prize, in 1913 an honorary degree by the University of Leyden.

WALTHER SCHÜCKING

Important works: *Handbuch der Friedensbewegung* (Vienna 1905; 2nd ed., 2 vols., Leipsic 1911); *Die Grundlagen des revolutionären Pacifismus* (Tübingen 1908; 2nd ed. with title *Grundlagen des ursächlichen Pazifis-*

mus, Zurich 1916); *Die moderne Friedensbewegung* (Leipsic 1907); *Das internationale Leben der Gegenwart* (Leipsic 1908).

FRIEDBERG, EMIL ALBERT (1837-1910), German jurist. Friedberg taught successively at Halle, Freiburg and Leipsic, and acquired a reputation as a canonist. It was Hinschius who awakened his interest in ecclesiastical law, and he turned to the problems arising from the increased legal demands made upon the state by the Catholic church in the Europe of the middle of the nineteenth century. An adherent of the historical school, like Eichhorn and like his teacher, A. L. Richter, Friedberg was the first to distinguish the purely juristic from the dogmatic aspects in the historic materials of the canon law, to strip ecclesiastical jurisprudence of its romantic and mystic veils and to transform it into something approaching his ideal of a purely juristic science. In his many articles in the period from 1869 to 1876 dealing with the problems of the relation of church and state in the Middle Ages and also with civil and ecclesiastical marriage Friedberg discovered the juridical foundations of ecclesiastical rights, at the same time, however, stressing their limitations and proving himself a scholarly champion of the positive rights of the state against the church. His keen, clear, objective judgments, based upon a profound scholarship, even influenced the religious policy of the German government of his time. He turned to new tasks after the conflict between the Catholic church and state in Germany, particularly as it concerned Prussia, had been settled. He published his famous edition of the *Corpus juris canonici* (2 vols., Leipsic 1879-81), in which he provided a critical commentary on the texts of the laws then in force in the Catholic church. He also collected the constitutional laws of the Protestant state churches in Germany as a preliminary to treating their constitutions systematically. Of his works the classic *Lehrbuch des katholischen und evangelischen Kirchenrechts* had the greatest circulation; it went through six editions and was translated into Italian, extending Friedberg's influence far beyond the borders of Germany. The distinguished Italian school of canonists was founded by his pupils.

GOTTFRIED LANGER

Important works: *Das Veto der Regierungen bei Bischofswahlen* (Halle 1869); *Die Geschichte der Civilehe*

(Berlin 1870, 2nd ed. Berlin 1877); *Sammlung der Aktenstücke zum ersten vaticanischen Concil* (Tübingen 1872); *Die Gränzen zwischen Staat und Kirche und die Garantien gegen deren Verletzung*, 3 vols. (Tübingen 1872); *Das geltende Verfassungsrecht der evangelischen Landeskirchen in Deutschland und Österreich* (Leipsc 1888); *Lehrbuch des katholischen und evangelischen Kirchenrechts* (Leipzig 1879, 6th ed. 1909).

FRIEDJUNG, HEINRICH (1851–1920), Austrian historian and publicist. Friedjung was born in Moravia of a Jewish merchant family. He studied at the universities of Prague, Berlin and Vienna and taught in the Handelsakademie in Vienna from 1873 to 1879. In his *Der Ausgleich mit Ungarn* (Leipsc 1877) Friedjung sharply criticized the constitutional agreement of 1867 which, he held, tore Austria in two; he was as a result dismissed from his academic position. Friedjung's work, both as historian and as politician, was characterized by a strong emphasis on the political state; a highly developed German national feeling, with the belief in the enduring community of interest between Austria and Germany; and a moderate form of centralized liberalism. In 1880 he collaborated in the formulation of a program for the organization of the German Volkspartei and in 1882 with Schönerer, Viktor Adler and Pernerstorfer he drafted the *Linzer Programm* which called for the closest union with the German Empire. He edited the *Deutsche Wochenschrift* from 1883 to 1886 and for nine months in 1886–87 the organ of the German Volkspartei, the *Deutsche Zeitung*. As a result of attacks by fellow members of his party, because of his race, he was forced to give up his position.

VIKTOR BIBL

Important works: *Kaiser Karl IV. und sein Antheil am geistigen Leben seiner Zeit* (Vienna 1886); *Der Kampf um die Vorherrschaft in Deutschland*, 2 vols. (Stuttgart 1897–98, 10th ed. 1916–17); *Oesterreich von 1848 bis 1860*, 2 vols. (Stuttgart 1908–12), unfinished; *Historische Aufsätze* (Stuttgart 1919); *Das Zeitalter des Imperialismus 1884–1914*, completed and edited by A. F. Pribam, 3 vols. (Berlin 1919–22).

Consult: Srbik, H. von, in *Deutsches biographisches Jahrbuch*, vol. ii (Berlin 1928) p. 535–45.

FRIEDLÄNDER, LUDWIG (1824–1909), German historian. Friedländer studied with Loebck, Lehrs and Hermann and taught at the University of Königsberg from 1847 to 1892. He devoted his attention at this time to studies on Homer and the Homeric scholia and on the

history of Homeric criticism from F. A. Wolf to G. Grote. Under the influence of Mommsen and the *Kulturgeschichte* of W. H. Riehl, Gustav Freytag and Jacob Burckhardt he began to devote all his energies to his life work, *Darstellungen aus der Sittengeschichte Roms* (3 vols. Leipsc 1862–71, 10th ed. 4 vols. 1921–23; tr. from 4th German ed. by L. A. Magnus and J. H. Freese as *Roman Life and Manners under the Early Empire*, 4 vols., London 1908–13), which is one of the best known studies of the Roman imperial epoch. From constantly accumulating material, which he always worked over anew and elucidated by various parallels from the Middle Ages and modern times, he made exceedingly interesting and universally intelligible portrayals seeking to set forth as a whole the time from Augustus to Commodus, covering the civilization of two hundred years of Roman imperial history. He ventured to treat so long a period as a unit because he maintained that in Rome the stability of the civilization was greater than in the modern period, that there human life was more intimately bound up with nature than in the north and, finally, that since historical transmission is not always sufficient and often but scanty it lets finer distinctions escape through its meshes. Friedländer sought to avoid all subjectivity and to describe the facts of the various forms of life in a realistic and objective manner. The colorful life of the city of Rome, the imperial court, the classes, society, the life of women, travel and communications, drama and music, literature and luxury, arts and religion, philosophy and the belief in immortality, as well as many minor features and oddities of life, are surveyed with keen insight; he paints the condition rather than the development, the actual antiquarian facts rather than the deepest intellectual grounds. Friedländer did not aim to write a profound systematic history of the civilization of Rome and its empire; but his work presents pictures from the life of Rome and its empire which make Rome seem so near and yet so glorious that the work achieved immense popularity, was translated into many languages and strongly influenced the conception of Rome of the last generation.

WILHELM WEBER

Consult: Ludwig, Arthur, in *Biographisches Jahrbuch für die Altertumswissenschaft*, vol. xliii (1911) 1–24.

FRIEDLÄNDER, MAX (1829–72), Austrian journalist. A member of the same Jewish family as Ferdinand Lassalle, Friedländer was a leading

publicist of the young "Forty-eighters" in Germany. After working on a liberal German daily, the Breslau *Oder*, in 1850 he went to Vienna and became a leading contributor to the *Presse*, the foremost liberal Austrian daily. When in the fall of 1864 reactionary moves to curtail the freedom of the press as guaranteed by the constitution frightened the publisher of the *Presse*, Friedländer with Michael Etienne and Adolphe Werthner launched the *Neue freie Presse*, which advocated constitutional liberties and German preponderance in Austria.

As editor in chief of the new paper Friedländer led a vigorous fight against the Belcredi cabinet which suspended the constitution. The liberal party rallied around the *Neue freie Presse*, which, expressing the liberal philosophy of the upper bourgeoisie, fought both reaction and really radical trends. Friedländer defended Austrian centralization, in which lay the germ of dissolution of the Austrian monarchy, against the idea of federalism advocated by Adolf Fischhof.

Friedländer's chief interest was not political, however, but journalistic. His was the first modern European journal of opinion and the leading literary and economic paper of the world. He introduced the feuilleton, that specifically Viennese production which won his paper great popularity and influence. This type of popular light articles about grave matters or grave articles about nothing in particular later degenerated into mannerism, and even the political and economic articles of the *Neue freie Presse* became glossy and velvety, attuned to the mood of a decadent and reactionary country. With the break up of the Austrian Empire the *Neue freie Presse* lost all but its local importance and became distinctly less liberal than it was under Friedländer.

A. CORALNIK

Consult: Zenker, E. V., *Geschichte der Journalistik in Österreich* (Vienna 1900) p. 66-67.

FRIENDLY SOCIETIES. Mutual aid in providing against the commoner risks of life—sickness, invalidism, death—took the form in Great Britain of friendly societies. These societies can claim a long lineage. In ancient Greece and Rome there existed clubs and unions of artisans and other workers whose purpose was to promote good fellowship among their associates and to assure them material help in time of need and eventually decorous burial. The true prototype of the modern English friendly society,

however, will be found in the early religious guilds, which were formed for social and secular as well as devotional purposes. Between the eighth and tenth centuries not only was the organization of the guilds completed and widely extended among the Anglo-Saxons but they were formally recognized in legislation. Still more directly the friendly society can claim descent from the craft guilds, which gained their greatest influence four or five centuries later. It is possible that no definite gap occurred between the English guilds, of which the last known survived until 1650, and their offspring, and that friendly societies simply carried on the work of the guilds after the old foundations had been confiscated by Henry VIII. The earliest known society in Great Britain still exists in an incorporation of carters founded at Leith in 1555. Other Scottish societies go back to 1634 and 1643. Daniel Defoe in the preface to his *Essay upon Projects* (1697) speaks of "friendly societies" as being at that time "very extensive." Eden, who traveled through England between 1795 and 1797 inquiring into the condition of the poor, found in the north "clubs of this kind which have existed above an hundred years." Several small societies established by the Huguenot silk weavers who settled in Spitalfields late in the seventeenth century are known to have been successful.

The friendly societies were an outgrowth of the times, which were hard for the working population, still predominantly agricultural. Since the reign of Elizabeth the civil authorities had granted poor relief to the destitute. But those in a position to help themselves eagerly adopted the idea of mutual aid in providing for emergencies. Local clubs were encouraged by two types of sponsors: the gentry, who partly through public spirit and partly with an eye to keeping down the poor rate became honorary members and guiding spirits in many a rural club; and the public house keepers, who profited from the numerous friendly societies, whose members often spent freely on drinks instead of paying rent for a meeting place.

As the industrial revolution hastened the growth of towns and separated the workman from his native parish, which owed him support, friendly societies multiplied, especially in the flourishing north. The clubs were small, often being limited to from sixty-one to one hundred and one members, attracted as much by the fellowship as by the protection afforded. Annual feasts were held in addition to the monthly

meetings. Eden with surprising insight for that time pointed out that the women's clubs would be sporadic as long as wives' earnings belonged to their husbands. The subscriptions and fines were kept in a strong box until needed for funeral or sickness payments. The financial principles on which business was transacted were of a rule of thumb order. The money benefits were small, but so also were the contributions, and there were doctors willing to attend members for a nominal fee.

The friendly society movement developed for some years before it attracted legislative attention. Defoe's prophetic suggestion of a national pension office passed unheeded. Eden, however, reports that from 1757 to 1770 an Act for Relief of the Coal-Heavers working upon the Thames provided for compulsory inclusion of all heavers in their benefit society with deduction of 10 percent of their wages for that purpose. In 1792 a similar law applied to the skippers and keelmen of the river Wear. John Acland, perhaps influenced by the experience of certain Devonshire parishes that had guaranteed local friendly societies' funds, proposed in 1786 a system of compulsory social insurance.

The government, although no longer able to ignore friendly societies, anticipated Eden's view that voluntary association would be most effective. Accordingly the Rose Act of 1793 for the "protection and encouragement" of "societies of good fellowship" provided that those societies which chose to register would be relieved from stamp duties and would acquire a legal personality. Under this encouragement the societies increased rapidly. The membership was estimated at 648,000 by Eden in 1801 and at 925,000 in 1815.

But the authorities, alarmed by the French Revolution, had grown suspicious of meetings. The Corresponding Societies Act of 1799 and the Combination acts of 1799 and 1800 included in their prohibitions all societies except the royally patronized Freemasons and the small friendly societies encouraged by the Rose Act. Branches of the still amorphous Odd Fellows were prosecuted as seditious. Trade unions were outlawed.

The craft unions at that time were so small and impromptu that they were hard to distinguish from friendly societies. Benefit clubs composed of members of one trade almost inevitably developed into trade unions. One of the earliest friendly societies on record was formed by the Newcastle shoemakers in 1719. Thus by empha-

sizing their benefit features trade clubs continued to exist in spite of the repression. The box deposits of the woolen croppers of Leeds enabled them to win a strike in 1802. The Royal Commission of 1825 discovered that in 1810 the spinners' union in the Manchester district had conducted business under sick club rules legally registered at Manchester. The commission concluded that "most alliances to raise wages cloaked themselves under the rules of Friendly Societies."

When after the repeal of the Combination acts the trade unions came into the open, their names, such as the Friendly Society of Operative Masons and the Flint Glass Makers' Friendly Society, and their organization into lodges with elaborate rituals show the closeness of their connection with the friendly societies proper. The unions of skilled trades have continued to pay sickness and death benefits in addition to the more usual unemployment relief and strike pay.

As industrialization proceeded, the growth on the one hand of Tory humanitarianism and on the other of radical agitation resulted in further governmental encouragement of friendly societies and similar working class attempts at thrift and mutual aid. The act of 1819 guaranteed a high rate of interest to funds deposited with the national debt commissioner. Ten years later Tidd Pratt, the barrister of this commission, was appointed examiner of friendly societies as well as of savings banks. After 1834, when the law broadened the definition of friendly societies to include any purpose not illegal, loan societies, building benefit societies and cooperatives developed rapidly. It will be remembered that 1834 was the year of the poor law reform. Finally by the acts of 1850 the great orders were officially admitted to the friendly society movement. In 1871 the trade unions were legally sanctioned and entitled to registry.

A new chapter in the history of the friendly societies had opened with the institution of federated "orders." Some of these orders had existed in the eighteenth century, but early in the nineteenth began the formation of the great affiliations, each with an elaborate and secret ritual copied from Freemasonry. The Independent Order of Odd Fellows, Manchester Unity, the oldest and strongest, was constituted about 1810; the Ancient Order of Foresters, the next in importance, was federated in 1834. More and more the federations captured the working classes until the investigators of the Friendly Society Commission of 1870 had to report that

everywhere the small clubs were being crushed out.

But Tidd Pratt, who was officially registrar of friendly societies from 1846 to 1870, continued hostile to the orders. However, he inveighed against the feasts and the public house connections of the small clubs as well as against the ritual of the orders; and, although the powers of the registrar have always been advisory rather than directive and registration has been purely voluntary, Pratt was largely responsible for the increasing emphasis on the benefit aspect of the friendly society.

Federation gave the affiliated orders greater strength, a better administration and a sounder financial basis. The absence of reliable sickness and mortality tables had led many of the early societies to insolvency. Pratt estimated that between 1793 and 1867 one third of the registered societies had collapsed. The correct method of calculating annuities had been much debated since Price devised his Northampton tables in 1780 for the Equitable Society, the first life insurance company. But Charles Ansell in his *Treatise on Friendly Societies* (London 1835) and F. G. Neison in his *Contributions to Vital Statistics* (London 1845) were among the founders of modern actuarial methods. The standard tables now in use are based on Manchester Unity experience during the five years 1893-97, as ascertained by Sir A. W. Watson. Not only is this experience used for the valuations of the great majority of friendly societies, but as regards insured males it provides the financial basis of the national health insurance system.

After the passing of the act of 1875 making quinquennial valuations compulsory the importance of maintaining parity in assets and liabilities could be ignored no longer. The practise of graduating contributions according to age at admission and the benefits insured for has been increasingly followed. Deficits on valuation have been met, where deemed needful, by the revision of rates of contribution or benefits. The Manchester Unity of Odd Fellows and the Ancient Order of Foresters assist branches in difficulty by grants from central funds created by levies on surpluses or otherwise. Nevertheless, one of the strongest arguments advanced in 1911 in favor of the state system of sickness and disablement insurance then instituted was the fact that a large proportion of the small friendly societies were still unable to meet their liabilities. Two special facts have contributed to the present virtual disappearance of the insolvency:

one is the considerable fall in sickness claims during the war years and the years immediately following, and the other is the higher rate of interest received on invested funds. The fact that no society has been unable to bear the abnormal strain of war claims is a striking attestation of financial stability.

The law which now regulates these societies is the Friendly Societies Act of 1896 (as amended in 1908), under which the collecting societies may also be registered. Registration is open to the following groups of friendly societies, some of which fall short of the true principles of insurance and mutuality: (1) the affiliated orders and their branches; after affiliation each branch remained an autonomous unit, having its own code of rules and scales of contributions and benefits and controlling its financial and other affairs; the branches are grouped in districts, whose business it is to see that the general rules of the order are carried out, and to administer the funeral benefit; (2) independent societies of the same mutual type, mostly local, with which may be ranked a small group of county societies with high contributions; these societies are still decreasing in numbers; (3) the centralized sickness benefit societies, the largest being the Hearts of Oak and the Rational, which are purely provident agencies, paying only cash benefits and making no claim to a fellowship character; (4) the deposit societies, represented by the National Deposit group, which act both as "limited liability" benefit societies and as savings banks; they are very popular, notwithstanding the fact that where the benefits come for the most part out of the members' individual contributions no provision is made for long periods of illness, still less for permanent invalidism; (5) the dividing or sharing out societies, known also as "slate clubs," "tontines," etc., which are usually local, provide only small benefits and distribute among the members at the year's end the whole or part of such balance of income as may remain after all expenditure has been met; (6) death and burial societies; (7) a number of local provident dispensaries and medical aid associations, mostly of old standing and of a semicharitable character; (8) a small group of railway benefit societies, miners' permanent relief societies and warehousemen's and clerks' societies; superannuation, pension and annuity societies.

If to these groups be added the juvenile societies, the total for the United Kingdom in 1927 exceeded 22,000 societies with approximately

7,500,000 members, of whom it is estimated that two thirds were insured against sickness and death. This takes no account of the large number of unregistered societies, for the most part small and providing modest benefits, which are still scattered throughout the country, and regarding which no numerical data are available.

This total disregards 74,000,000 industrial insurance policies outstanding in 1928, 17,000,000 issued by collecting societies and 57,000,000 issued by industrial assurance companies. Although these societies were developed after the commission of 1853 had found that existing friendly societies were providing only for the needs of the skilled workers, a large proportion of industrial policies today are unquestionably held by members of friendly societies.

CHIEF BRITISH FRIENDLY SOCIETIES

	Member- ship 1910	Member- ship 1920
National Deposit Friendly Society	219,381	781,477
Independent Order of Odd Fellows—Manchester Unity	759,488	752,079
Independent Order of Rechabites—Salford Unity	320,739	713,069
Ancient Order of Foresters	621,375	572,044
Hearts of Oak Benefit Society	303,483	424,943
Loyal Order of Ancient Shepherds—Ashton Unity	165,262	251,574
Order of the Sons of Temperance	170,755	242,030
Rational Association Friendly Society	120,118	108,441
	2,680,601	3,845,657

The large migration from Great Britain and Ireland which began early in the last century carried the friendly society to all the present dominions and to some of the smaller colonies as well as to the United States. In general English traditions and legislation have been followed. The success of the movement has been most marked in Australia, where there were some 5000 societies and branches in 1928, nearly one half of them attached to the orders of Odd Fellows (Manchester Unity) and Foresters. Special features of the legislation there are compulsory registration, the omission of invalidism, superannuation and maternity benefits, since these are provided by the commonwealth out of the general taxation and the state subsidies given in New South Wales.

When the National Health Insurance Act of 1911 was passed, imposing on some 15,000,000 persons the obligation of insurance against sickness and disablement, the fear prevailed that

the days of the friendly societies were numbered. That fear was not shared in circles conscious of the strong sentiment of attachment and loyalty which is common to all the great orders. Continuity in some form was inevitable owing to the fact that a very large number of members were excluded from state insurance by occupation, age or the income limit or were unwilling to exercise the right to become "voluntary contributors" under the new system. Such persons therefore had claims on their societies which could not be repudiated or even easily commuted.

Whatever danger may have seemed to exist was removed by the permission given to the federations and the larger independent societies to act as "approved societies" for the administration of the statutory sickness and disablement benefits in cash, a privilege accorded also to the trade unions; while the industrial assurance companies were allowed to form independent "approved societies." Given the opportunity of dropping so much of their benefits as was provided by the state scheme and of reducing their contributions to the extent of the new state contributions, the general decision of friendly society members was in favor of maintaining their existing insurances. The work of the societies was continued in un-reduced volume with the state benefits as a supplement. Inasmuch, however, as the new law took over the provision of medical attendance and medicine, treating it as a benefit separate from sickness pay and entrusting its administration to statutory bodies called insurance committees, the contributions of state insured members were reduced by the amounts which they had hitherto paid for that service, while as regards the members who were not so insured new and on the whole more onerous arrangements had to be made for their medical treatment. It is estimated that the societies are today still giving benefits to some four million members who are also compulsorily insured. It should be added that all persons who come under the health insurance scheme are also insurable under the act of 1925 for the provision of pensions to widows, orphans and insured persons aged sixty-five to seventy, when free pensions can be claimed under the acts of 1908 and 1924.

The fact that the operation of the statutory system has largely coincided with entirely abnormal social conditions caused by a great war and a prolonged period of unexampled unemployment forbids any satisfactory estimate of

its influence upon public health and well-being; while the close interaction of the voluntary and compulsory agencies, whose benefits fall to the same classes of the population, makes it impossible to divide credit due for whatever improvements have occurred.

Of the place of the friendly societies in social life generally it is possible to speak more definitely. Throughout their long history the societies have proved potent agencies in the advance of the working classes. The practise of estimating the value of these societies according to their influence in reducing the number of the dependent poor persists no longer. While all the evidence available indicates that friendly society members rarely seek public relief, it is not in that direction that the principal efficacy of these organizations must be sought. Hardly any movement or cause conducive to self-help and popular welfare and progress can be mentioned which has not owed much of its strength and success to the efforts of the men and women in these societies. Although during the past thirty years, which have witnessed so large an extension of social service legislation, there have appeared signs of a distinct tendency on the part of the working classes to look to the state for assistance, the spirit of self-reliance remains vigorous today in the friendly societies.

FRÖBEL, FRIEDRICH (1782-1852), German educator. Fröbel was the son of a Thuringian clergyman and his childhood was almost hermitical. Early impressions of nature and the church led him to seek "a life of self-realization in the country" and he became a teacher in 1805. After observing Pestalozzi's work in Yverdon from 1808 to 1810 he undertook to defend youth's creative power against "agglutinated" information. He believed in the unity of nature and in the infinite gradation of the entire universe, which he regarded as a divine educational institution. From 1811 to 1816 he attended the universities of Göttingen and Berlin in order to find support for his beliefs and later became assistant in connection with a mineralogical collection at the University of Berlin. There his study of crystals, in which he saw "the greatest in the smallest," confirmed his faith in a cosmically adjusted educational method. He attempted to put his theories into practise in a pioneer workers' school which he had founded in Keilhau, Thuringia, in 1817. On the basis of this experiment he wrote his principal literary work, *Die Menschenerziehung* (Keilhau 1826; tr. by J. Jarvis, New York 1885). He was disappointed by the misuse to which his ideas were put by quarreling sects and political groups and turned to infant education.

For the early training of the child's soul and mind he arranged a series of toys (balls, bowls, mathematically cut bricks) as "gifts," through which the play of the baby was to develop freely and regularly. The child was to copy forms of utility, beauty and understanding which it saw at home or imagined, for Fröbel cared only for a gradual development of self-activity. The task of the educator, according to Fröbel, is to nurse the awakening senses, translate childish ideas and imagination into words and fix these by repetition in song. As a transition to the ordinary school Fröbel organized in 1840 the kindergarten. Here, where children imitated naïvely the activities of the adult world, he saw their eager, intuitive simplicity striving toward a moral social order. His whole method aimed at making the child through its play feel at home in an orderly cosmos, a process he called rounded life harmony (*allseitige Lebenseinigung*).

His mature sociological attitude was expressed in a letter of 1834 as follows: "No community can progress in its development whilst the individual, who is a member of it, remains behind; the individual, who is a member of the whole body, cannot progress in his development while the community remains behind." A firm believer in innate virtue, Fröbel may be described as a German Rousseau. He had lived in his childhood what he later taught and he therefore taught only what he had himself experienced. His educational ideas have enjoyed a wide following, especially in Germany and the United States.

FROISSART, JEAN (c. 1337-c. 1404), Norman English historian. At the age of about twenty-three Froissart followed Queen Philippa from Hainault to England and became her secretary. Encouraged by her he began to write a history of that great conflict between England and France which later generations have called the Hundred Years' War. For the earlier years (for it had lasted a whole generation before Froissart began to write) he borrowed freely from Jean le Bel, canon of Liège. In England Froissart met many of the principal actors in these wars and collected much material at first hand. After Philippa's death he remained under pro-English patrons until about 1373, when he became the pensioner of Guy de Blois. The second half of his *Chronicles* is more favorable to the French than is the first, and a third edition, represented only by a single manuscript in Rome, contains a few unpleasant reflections on England introduced after Queen Philippa's death.

He is not an accurate historian in the modern sense. While he took pains not only to collect but to check evidence he is in conflict with the testimony of more formal documents on many points, some very important. But nobody has rendered better than he the atmosphere of mediaeval life, seen through upper class spectacles. In him are both the strength and the weakness of the chivalric ideal. He was, how-

ever, not insensible to the sufferings of the poor and shows clearly that there was much justice in the claims of the rioters in the Peasants' Revolt of 1381. Such a volume of selections from the *Chronicles* as that published by G. C. Macaulay (London 1895) is an excellent short introduction to the study of mediaeval life.

FRONTENAC, COMTE DE PALLUAU ET DE, LOUIS DE BUADE (1620-98), French colonial administrator. Frontenac's distinguished military services in France won for him an appointment as governor of New France in 1672. Ten years later, as the result of quarrels with Intendant Duchesneau, he was temporarily recalled in 1682 to France. But the blundering Indian policy of his successors, La Barre and Denonville, involved the colony in such a critical war that in 1689 he was again sent out as governor, an office which he continued to hold until his death in 1698. During both periods of his administration Frontenac played an important part in molding the political evolution of New France. Instructed by the home government to restrain the political activities of the ambitious ecclesiastical leaders in the colony, he eventually succeeded in curtailing the influence of Bishop Laval and the Jesuits in administrative matters. Although believing in and practising autocratic rule Frontenac encouraged active cooperation on the part of the colonists. He held a meeting of the three estates, created a system of elected aldermen with judicial jurisdiction—a striking departure in French administration—and instituted biennial meetings of the citizens to express their views on matters of general concern. Under his aggressive direction the boundaries of New France were rapidly extended to the south and west, and in the wake of the explorers followed traders and builders of forts. In his attempt to convert the Indian tribes into staunch allies of France Frontenac displayed a remarkable genius, mixing authority with kindness and firmness with paternalism. He was equally capable as

a military leader both on the offensive and in defending the colony from invaders.

FRONTIER

AMERICAN HISTORY. Apart from the meanings generally given to the word frontier it suggests an important theory of American history. Until 1893 the word had been often applied to political or military borderlands or to a twilight zone within which creative thought might be expected to reveal new truths. In North America it had been connected with the region lying at any moment between the settled portions of the continent and the region of untouched nature and aboriginal man. As "the West" it had aroused curiosity and had drawn observers, a few of whom had glimpsed the idea which Frederick Jackson Turner, then a professor in the University of Wisconsin, formulated in his monograph, *The Significance of the Frontier in American History* (1893). Turner had been studying the occupation by English speaking settlers of the region just beyond the Appalachian watershed, using the unique collection of manuscripts, assembled by Lyman C. Draper, which belong to the State Historical Society of Wisconsin. He saw a possible meaning in the fact that here for the first time in modern history, if not in all history, a people with an advanced culture found itself living next to an unlimited area of unowned or slightly valued land, from which the common man could capture for himself what he needed and upon which he could build, free from most of the restrictions of congested society, what personal life he was capable of and what social structure he desired. This hypothesis gave a new and important meaning to the history of the United States. It remains unproved, as must most hypotheses in the philosophy of history; but its reasonableness and its capacity to give a rational interpretation to events have brought about a rewriting of the whole American story in its terms. Only Edward Channing among the major historians has escaped its influence; and he although distrusting it as an explanation made no attempt formally to disprove it. Many historians in varied fields have been inspired by it to examine the frontiers of South America and of Russia and the remoter

frontiers of antiquity and of Europe in the Middle Ages but with results less startling than those which Turner suggested.

The special conditions which made possible the episode of the frontier in the experience of the United States include an English policy which permitted the easy emigration of dissatisfied individuals during the period between the planting of Jamestown and the end of the French wars; the scarcity of exploitable wealth in those parts of North America to which British emigrants had access; the river systems of the Atlantic seaboard, which assisted penetration inland from the coast; a sparse aboriginal population, reduced to fractional dimensions by the frontier of European disease which preceded the English entry, and the partly cultivated areas upon which Indians had dwelt, which indicated sites for residence and made easier the first steps in occupation; and the adoption by the United States of a land policy encouraging the speedy appropriation of the land by small holders.

Without the free emigration permitted by England and the generosity of English law that gave to overseas colonists the rights of Englishmen the English settlements in America might not have escaped the course followed by Spanish and French settlements. These latter failed to set up in the New World detached fragments of the parent country. New France and New Spain were new cultures rather than transplants; whereas New England and Virginia were old cultures with only such modifications as time produced and as environment and neglect encouraged. There was little desire among the powerful of the Old World to capture and appropriate the resources of the English region, for the resources were cheap and at that obtainable only at the cost of bitter labor. Attempts to build up American estates, such as those of the Penns and the other proprietaries, were unprofitable. The cost of protecting the rights of an overlord was out of proportion to the profit to be derived; and from the beginning of settlement the settler was an uneasy underling. However tractable he may have been at home (and most of the settlers were people with little tradition of wealth or dignity), the colonist in America became an aggressive individualist who ignored restrictive laws or perverted them to his own use. It was not profitable for anyone in England, whether with property right or with governmental authority, to make the effort to reduce the farmers of the American frontier to a lock step with vested interest.

The farmer of the frontier has especially interested those who have studied frontier influence. The other frontiers in advance of British civilization in America were anticipatory to his, but had the farmer not followed to convert the country to agricultural use the other frontiers would have lacked meaning. Before him in succession spread the frontiers of exploration, of military control, of missionary activity, of the fur trader and trapper. All of these had been preceded by a deadly frontier of European disease; after them came frontiers of local government, of railroad penetration, of financial sufficiency. But the agricultural frontier, with a new and sparse population of from two to six inhabitants to the square mile, was the significant frontier agent.

The influence of American frontier life was dispersive, throwing the individual upon his own resources: he was probably more than normally willing to be thrown upon himself, because in many cases the English who selected themselves for emigration were in some way more stubborn than their relatives who remained at home. Most of them came from economic motives to find a larger life. Mingled with them were others, nonconformist by temper, who preferred to pay the price of comfort for the opportunity to live politically, religiously or socially as they pleased. England was more comfortable with them gone; and they were not the raw material for an acquiescent dependency three thousand miles away.

Amid frontier conditions such emigrants set up on the Atlantic coast in the seventeenth century a new England which began at once to deviate from the standards of old England, the deviation not being recognized until it had gone too far to be checked. The first frontier was of necessity on the coastal plain with urban concentrations at suitable harbors where immigrants might land and whence exports might be moved. In successive decades the Atlantic ports of entry developed as the centers of business and government, and successive increments of settlers found their way along the river valleys to where coastal plain and piedmont meet and to the mountain valleys behind. The major rivers led to the obvious gaps, with the Susquehanna and the Potomac marking the chief routes to the valley system of the Appalachians. Once beyond the piedmont edge the standard channels of penetration broke down, and settlement was dispersed northeast and southwest in directions generally parallel to the seaboard. The mountain

valleys became a mixing basin for social contributions from all the colonies and for all the races that had a part in the process.

At every stage of its advance on the cutting edge of the frontier was the single family farmer, whose cabin on the margin of settlement was a nucleus whence spread the occupation of the wilderness. From the time when the earliest resident made his appearance to build a home until the time some twenty-five years later when his first born child left home to repeat the process, there developed a typical cycle of events that has repeated itself *mutatis mutandis* in nearly every county in the United States and in every decade from 1600 until 1900.

The repetition of the frontier cycle over small units for three hundred years constitutes an approximation of a series of laboratory experiments in social establishment. The free farmer doing his own work and accomplishing only what he and his family could encompass faced the task of creating farm and home. He was remarkably free from the restrictions of precedent, the dead hand of property interest and the retarding influence of information. He could never be persuaded that he had not in fact made his farm himself; and he never willingly admitted that he owed to any jurisdiction a price in payment for his land. He had few pieces of wealth worth taxing and scant willingness to submit to the imposition of any tax not convenient to pay or not imposed for a benefit that he appreciated. During the twenty-five years of the cycle in any region the land passed from wilderness through a stage of scattered farmsteads and became an agricultural community with county town, roads and schools, institutions of government and a partnership share in a nation. No individual who lived through the process could avoid being shaped in some ways by his experiences. His life, his mentality and his ideas of business and government all tended to derive from the experiences of working with fresh materials and in new units. Social creation was going on, not accomodation to the matrix of an accepted and dominant existing civilization.

The racial components of the wave of immigrants whose labor cleared the continent up to the Appalachian watershed by the middle of the eighteenth century were various with variations that tended to lessen before generations of common life and experience. The English came first carrying the intellectual cargo of seventeenth century England, with notions of common law, free church and controllable government natural

to the century. They planted Virginia and New England, worked their way into control of the little settlements of Dutch and Swedes, occupied the shores of the Chesapeake and Delaware and began the easier cultivation of the southern coastal plain in the Carolinas. Early in the eighteenth century the Germans came, made ready for emigration by starvation and persecution in the Rhine valley, and settled west of the English counties of Pennsylvania and in the Mohawk valley above Albany. By their side the descendants of the Ulster Scots came from the north of Ireland, and from the rest of Ireland and Scotland came enough residents to give to each race a distinct part in the development of the American frontier. On that frontier or, more precisely, on those frontiers in the second and third generations there was admixture of blood that lessened the significance of racial origin and enough concealment of names by marriage or by translation to render forever impossible the task of separating the new race of Americans into its racial stocks. The Scotch-Irish moved beyond the English and the German settlements to cheaper lands and between 1763 and 1819 contributed typical farmer volunteers along the cutting edge of the advancing frontier line.

For a century and a half after the first plantations the frontier in America was a European frontier which had sprung directly from its European base. By the middle of the eighteenth century, when England drove France from the continent and proceeded to reorganize the colonies and to erect controls over the direction and speed of occupation of the land, there was an American social base in the older colonies against which for the remainder of the frontier period it is possible to measure the changes brought about by exposure to frontier life. After the Peace of Paris and the Proclamation of 1763 it became more and more an American frontier.

Among the causes that produced the separation of the United States from England was the English decision to interfere with the occupation of the interior of the continent. Regulations were in vain; Americans defied them without qualm. The common problems of the colonists became clearer along the border than they were among the separatist seaboard establishments. The common lands in the west, gained at the treaty of peace, nearly wrecked American federation; but that once accomplished they constituted one of the earliest forces to give to the new government a national aspect whether under the Articles of Confederation or under the constitu-

tion. Repeatedly after the inauguration of Washington new political movements originated in the west or gained there a force, undiluted with doubts, that made them impressive. Continuously the west drew from the young, the ambitious and the poor to recruit new frontier settlements. The people of these settlements had energy and unanimity in pressing their demands for measures of relief upon the government, which they regarded as essentially national.

As the process of occupying the continent continued under the constitution, the repetitions of the creative process of the frontier cycle operated as a filter upon the ideas and the institutions of the older east which were transplanted and modified in the governments of the newer states. There were few restrictions upon the type of government that the new states might erect. There dropped out of sight among the western states many of the qualifications which the eastern colonies had inherited from their English background. Manhood suffrage and eventually woman suffrage took foothold in the west. Free schools and state education gained ground. Qualifications for elective offices were whittled away. There was a definite political liberalism and a practical democracy that led the west and its leaders not only to erect progressive governments for local use but to wage war against what were regarded as the conservative and aristocratic habits of the east. The parties of Jefferson, Jackson, Harrison, Lincoln and Bryan indicate, in turn, waves of political emotion for which the west on or near its frontiers provided breeding grounds. Each advanced from the west toward the east as its philosophy gained a national acceptance.

The typical frontier cycle appeared with the first settlements on Atlantic tidewater and it repeated itself so long as there remained land capable of development by the cabin farmer. By 1800 the frontier states touched the Mississippi. By 1821 nearly the whole of the United States, as the boundaries then were, was occupied by states or prospective states; what land remained beyond the western boundary of the new state of Missouri was generally regarded as incapable of sustaining the typical agricultural life. Within the next thirty years the political boundaries were projected to the Pacific, the western coast was discovered to be both habitable and desirable, and much of the intervening country was held to be too good to be left to the primitive usages of aboriginal man. New tools were necessary to reclaim the trans-Missouri and to

bring it within the reach of the frontier farmer; but new industrial methods in the mid-century provided them. By the date of the census of 1880 the statisticians of the government were prophesying the speedy disappearance of free land. By 1890 the American frontier in its special sense was gone; more than gone, since in the enthusiasm of the final phases the land had been broken on the high plains and along the slopes of the Rocky Mountains, where it was not normally capable of sustaining the single family farm of American experience. There was a recession of the occupied frontier during the next decade; in the forty years since 1890 farms have not again reached the margin of the greatest development.

With the disappearance of the frontier this episode in human experience came to an end, without precedent and without probability of repetition. It is likely to remain the peculiar part of the heritage of the United States. For three centuries the common American had an easier opportunity to become a free economic agent than did any of his contemporaries. The democratic aspect of American life, its fluidity and its adaptability appear to have some connection with this environment. The American ideology which assumes freedom to be the common lot of man may be a part of it. American restiveness under remote or absentee control seems to derive from it. American suspicion of Europe may be a reaction toward a world whose narrow opportunities made men through ten generations willing to leave its fold. The hypothesis that Turner phrased continues therefore to account for much that is vital in the interpretation of American history and of American status in the world, now that the frontier itself is gone.

FREDERIC L. PAXSON

GEOGRAPHICAL AND SOCIAL ASPECTS. The frontier, or the pioneer belt, is the initial stage in the settlement of a new region by representatives of a stronger civilization. It is characterized by sparsity of population, self-sufficing economy and the crude living conditions and uncouth manners of the less complex cultures. The line of frontier settlement in America was drawn by the Bureau of the Census at a density of six persons per square mile. The frontier is thus a fact of social demography and should be carefully distinguished from the state frontier, which is a political and military boundary (*see* BOUNDARIES). Among the conditions which make frontiers possible are unsettled boundary lines, unexplored and unclaimed territories, virgin soils,

free or nominally priced lands and large or unrestricted immigration. Pioneer belts of historical importance are found in west Australia, South America, especially the Argentine, north-west Canada, Siberia and Rhodesia. They differ from the American frontier largely in possessing lands more subject to extremes of either rainfall, climate or inaccessibility; in leaving less to the untrameled individualism of the settlers and more to governmental policy; and in allowing the unpropertied less access to public domain by requiring for its exploitation a larger amount of capital. Another difference lies in the fact that the present pioneer does not, like the early American pioneer, leave behind him security, but rather the amenities of culture, the artifices of comfort and the power of a more highly mechanized civilization.

The geographical phases of the movement of a frontier may be best studied in the case of America. As population spread from the Atlantic seaboard to the Pacific in a series of successive waves, the frontier expanded not as a uniform belt but in patches and strips. The first to be settled, such fertile and accessible areas as the tidewater, blue grass, limestone valley, black land, delta and prairie, became the centers from which the less attractive surrounding regions were organized as new frontiers. At each advance the reversion to untamed nature and primitive tasks, for which there existed no division of labor and no considerable technology, carried with it a regeneration of frontier modes of life. The vanguard of the advance was led by "long hunters," explorers, trappers, scouts, outlaws, prospectors, gold rushers, Indian traders and *coureurs de bois*. They made the initial contacts with the Indians and learned the folkways of the wilderness. Following these came the main stream of hunters, ranchers, frontier farmers, traders and miners. The frontier, however, did not of necessity recapitulate in its history the orthodox stages of economic organization: hunting, pastoral and agricultural. The Kentucky blue grass, for example, was first settled by farmers who afterward adopted grazing, only to replace it later with diversified farming in which livestock played a large part. As hunting diminished, cow pens, canebrakes and uplands became the centers of a respectable grazing economy, while the ease of settlement in any section whence cattle could be driven to market was often noted. The chief settler was likely to be a squatter farmer with a horse, a cow and a few swine, who settled in a forest clearing, large

enough for his log cabin and a corn patch, near a few neighbors of similar tastes. When population became so dense as to disturb the hunting and restrict the range, such a settler was likely to sell to some substantial immigrant and move to the next frontier. As a more stable agricultural industry grew, frontier transportation developed to supplement its economic autonomy. It was manned by pack horse traders, hog and cattle drovers, stage drivers and the roustabouts of the river trade, all of whom served to connect the back country with its markets.

The successive advances naturally created many frontiers whose temporary stopping places were largely suggested by terrain. There was a frontier at the fall line and another at the Appalachians; an army post frontier and a salt springs frontier. Spanish frontier, French frontier and Indian frontier, Puritan and tidewater, old west and old northwest, southwest and middle border, prairie and plains, California and Oregon country—these are but variations on a more fundamental geographico-economic classification into three types: the eastern frontier of forests and clearings, the western grasslands of prairie and plains, and the western mountains and mining frontier. In fertile areas of the south the frontier gave way to the plantation, but it was not until it debouched from the forests to the grasslands that the frontier changed from the farm to the free range. When the extinction of the buffalo made it easy for the federal government to confine the Plains Indians to their reservations, the cattle man replaced the buffalo by the long horn and extended the range frontier to the Rockies. In the high plains low rainfall repelled dense agricultural settlement, thus making for the modification of some frontier traits and the retention of others. The transition from free range to ranch, begun by the innovation of barbed wire, was officially signalized when in 1884 a special session of the Texas legislature made it a penitentiary offense to cut wire fence. Whereas property had existed in cattle, it was now established in land. It remained for the extensive ranches to give way to the advancing hordes of small farmers before the frontier process was completed. The mining frontier, established by the California discoveries of 1849, began in the farthest west and retreated eastward as far as Nevada.

By gradually changing the settled farm villages of Europe into isolated farm homes the frontier formed the physical basis of rural community life in America. Virginia first set the pattern of

extended "string town" settlement along her tidal rivers. Pioneer upland farmers settled in forest clearings around a stockade. No community life was possible on western prairies after the passage of the Homestead Act, for each settler was required to live on his 160 acres for five years. Had every quarter section been open to occupation, each family would have been located on the average half a mile distant from its nearest neighbor. This barrier to social intercourse and group organization made for a continuation of frontier conditions in well populated agricultural districts.

By nature and necessity separate and independent, the pioneer developed a self-reliant and aggressive personality. Forced to become a jack of all trades, he ended by developing a confident individualism and a studied disregard for instruction and experts. He came to believe that a fool can put on his own coat better than a wise man can do it for him and that almost any kind of timber can be worked into the political ship. Where none were rich, learned or polished, a backwoods democracy prevailed which desired no aristocracy, no civil service, no learned or professional class. The frontier also developed a certain ruthlessness, evident in its dealings with the Indians and in the exploitation of the public domain. Its rough and tumble fights developed after the invention of the Colt revolver into the dueling code of the cow town and mining camp. It set up its own system of law and its own conception of order. It eventually made horse stealing a capital crime and relegated murder to the category of casual accidents.

Frontier society was not all individualism and competition in the exploitation of public domain. Out of crude contacts grew spontaneous associations. The frontier farm was a fostering habitat out of whose domestic economy came the rapid and easy growth of the family. In its closely knit unity children furnished needed labor, married early and received lands from the family or settled farther west. Hospitality was a kind of mutual aid to be extended in sparsely settled sections, while logrollings, house raisings, husking bees, camp meetings, mining camps, vigilantes and the squatters' and cattle raisers' associations testified to the amount of voluntary cooperation. Indian peril and common hardships served to consolidate the community and to combine in its government democratic and summary tendencies.

Moreover, the accumulation of contrasting traditions tended to set the frontier off from more

populous areas in its attitudes. Sectional antagonisms early developed with the seaboard states, which used the pioneers as buffer settlements against the Indians and failed to accord growing upland counties their proportionate representation in state legislatures. Questions of boundaries, internal improvements and the clashing economic interests of producing and consuming areas arose to make relations more strained. The dominant political attitudes of early frontiersmen were nationalist, expansionist, imperialist; they advocated internal improvements and military action against all Indians. Later their debtor-creditor relation with the east intensified their attitudes, and the west came to be known as the home of Greenbackers, populism, free silver, the initiative, referendum and recall, farmers' blocs, non-partisan leagues and party insurgents.

The frontier has had considerable impact on American economic life and opinion. It opened a new economic hinterland with its wealth of resources and its problems of internal improvements and government control. It gave the common man easy access to the public domain. The difficulty of maintaining a labor supply in the face of free land was partly met in different sections by slavery and immigration. The presence of unassimilated Negroes and immigrants conspired with the native working man's tendency to take up lands in the west to retard the growth of an American labor movement. The laissez faire philosophy of the frontier meant freedom to exploit natural resources. The situation encouraged land grabbing, hasty skimming of natural resources, corrupt politics and speculation in mining, ranching and real estate deals. Mistakes were quickly cured by expansion into the public domain, and the resulting prosperity constituted an argument in favor of lax policies. In this sense the heritage of the public domain has left America a generation behind Germany and England in programs of social legislation.

In other spheres the frontier has dissolved old patterns and directed an insurrectionary attack on new ones. It cut the ground from under the traditional aristocratic political thinking of the Federalists. It displaced the ideological democracy of the thinkers of the French and American revolutions by a workaday democracy that glorified the common man while it left the actual machinery of government to professional politicians and a spoils system. It served as the setting of experiments in political and social adaptation and in the wheat belt aided in assimilating certain foreign groups. In religion it was

important in substituting sects for a more comprehensive church and emphasis on revivals and emotional experience for religious nurture and confirmation. The state theocracy of Episcopalian Virginia and Puritan New England failed to survive the frontier, and the aristocratic implications in the predestination and election doctrines of the Scotch Presbyterians proved unacceptable to the backwoods equalitarianism. The emphasis on ritual was loosened, the demand for an educated ministry abrogated, and the circuit riding Methodist and Baptist preachers took their toll of more conservative sects. The frontier gave American literature new subject matter and a new viewpoint, reaching characteristic expressions in David Crockett's *Autobiography*, Bret Harte, Hamlin Garland and, above all, Mark Twain.

FROUDE, JAMES ANTHONY (1818–94), English historian and man of letters. The reputation of Froude as a historian stands higher now than in his lifetime. His literary rather than historical training and methods, the difference of his judgments from those traditionally held and the bitter controversies he aroused all tended at first to deter serious readers and fellow historians from accepting his work as of solid value. As time has gone on, however, his excellences have compelled recognition. Among these his industry takes a high place. The twelve volumes of his *History of England* were written within the years between 1856 and 1870 (new ed. London 1893), and the work of preparation for them was done, after the first six years, while they were being written. His three courses of lectures as regius professor of modern history at Oxford, to which position he was appointed in 1892, were each a piece of independent historical research on a large subject. His other historical and biographical writings, his more purely literary essays, most of which were gathered in the four volumes of *Short Studies in Great Subjects* (London 1867–83, new ed. 1891), his accounts of his colonial journeys and the Carlyle correspondence carried his published work to thirty-eight volumes, produced in forty-four years.

He was partisan, sometimes careless in the use of his sources and he overemphasized the historical importance of great men, but his mis-

takes are hardly more numerous than those of other historians of his time. The extent of his labors, his eloquent style, his insight into characters and events, his correction of narrow traditional views and his capacity to interest a vast number of readers command respect and admiration. He was brought into contact at Oxford with Newman and other leaders of the Tractarian movement but soon emerged from their influence into a mild form of skepticism. His departure from orthodoxy, especially his publication of *The Nemesis of Faith* (London 1849), excluded him from clerical and educational life and forced him to make his living by his pen. He lived for twenty years in the closest intimacy with Thomas Carlyle and was entrusted by him with the duty of writing his life and editing his correspondence and that of Jane Carlyle. His inexorable truthfulness in portraying the characters and married life of the Carlyles brought upon him much criticism.

In 1872 and 1873 he lectured in the United States on the Irish question, contending that the Irish were incapable of governing themselves and must therefore remain under English guidance. In 1874 he was sent by the government to South Africa and later traveled in Australia and the West Indies making observations and reports on colonial conditions which are a curious combination of anticipations of what has since actually occurred with disparagement of the democracy which has alone made those changes possible. He was a convinced imperialist, believing that it was the duty and the proper destiny of Great Britain to remain the center of a group of English speaking colonies, whose attachment he believed could be retained by considerate and wise treatment. He believed that the empire should be held together as a place for the extension of British population and for its bracing effect upon the character of British people at home.

He disliked *laissez faire* and the ideals of the Manchester school in general, drawing in the concluding pages of *Oceana* (London 1886) a striking if dark picture of a purely industrial and degenerate England which he feared would result from the supremacy of those ideals.

FRUIN, ROBERT JACOBUS (1823-99), Dutch historian. Fruin was born in Rotterdam of English ancestry and studied classical philology at the University of Leyden. The works of Heeren, Ottfried Müller and Niebuhr turned his attention to history, and after preliminary work in Egyptology he devoted his life to the study and teaching of the history of the Netherlands. He was professor of history at Leyden from 1860 to 1893 and after 1868 also editor of *Bijdragen voor vaderlandsche geschiedenis en oudheidkunde*.

Fruin has been called the Ranke of Holland. His work marks the beginnings of the scientific study of history in the Netherlands. Despite the fact that his writings were mostly in the form of scattered essays and addresses they were the most potent influence in the stimulation of historical investigation in Holland. His interest embraced the whole field of Dutch history, but his best work was done on the period of the sixteenth and seventeenth centuries. In *Tien jaren uit den tachtigjarigen oorlog, 1588-1598* (Leyden 1859, 6th ed. The Hague 1904), Fruin's most celebrated work, "all the great problems of the history of the Dutch Republic are firmly indicated." A determinist in his philosophical outlook, a liberal in politics and religion and a follower of the rationalist humanist tradition of Erasmus, he was attracted more to the objective historical method of Ranke than to the moralistic pleading of Mommsen. He attempted to understand and enter into sympathy with the thought and the milieu of the people and periods he described. The question of motive was for him the central problem of historiography. Although an admirer and follower of Ranke he adopted in his later writings more of a genetic approach to historical problems and criticized Ranke for his overemphasis on political history and his failure to deal adequately with social, intellectual and institutional history. He also expressed his de-

cided opposition to the formulation of historical laws as propounded by Comte and Buckle.

FRUIT AND VEGETABLE INDUSTRY.

The cultural history of fruits and vegetables goes back to remote antiquity, but their commercial history is largely confined to the last century. Transcontinental and transoceanic shipment of fresh products on any considerable scale began within the business life of men who are still active. In the United States the first car of vegetables under refrigeration crossed the Potomac River on its way north in 1887, and in the same year the first car of California fruit under refrigeration crossed the continental divide.

The fruits which were identified with early civilizations were either easily preserved by primitive means or yielded a semipermanent product. The olive became a source of oil on lands so arid and in climates so hot that animal fats were hard to produce and impossible to preserve. The date of the tropical desert oasis was easily dried and usable throughout the year. The fig early became the dooryard tree of semitropical races permanently located in regions of light rainfall. If irrigation was possible the vine and the fig were closely associated, as in California today. Inhabitants of humid tropical regions have always been and are still dependent largely on the orange or the banana, each available on the tree practically throughout the year in a climate which precludes fruit preservation. Diluted sour wine first became important to peoples whose water supplies were scanty, often alkaline and always warm.

For centuries the difficulties of primitive ways of communication precluded most commerce, even in dried fruits. When the wooden cask was devised as a container for fluids, displacing earthen jars and skin bags, long distance water transportation of dried fruits and wines became possible. The classical Mediterranean trade in dried fruits was extended gradually by sailing vessels to the northern European and British ports. Although the Roman occupation extended the cultivation of pears and apricots in France and of apples and cherries in Germany, the monastic and court gardens alone preserved their

culture during the Middle Ages. Even today the peasants of eastern Europe raise little fruit.

Fruit growing thus became specialized through the rigid limitations of climate in the days when canning and refrigeration were unknown and before sugar was available as a preservative. When the struggle for existence was largely a struggle for food, the fruit which afforded the most sustenance from a given space or a given supply of moisture tended to supplant all others. Mixed orcharding, affording a considerable choice of fruits for local use, came only with stability of population and a considerable advance in the standard of living.

Diversified fruit culture, where climate permitted, has kept pace with the increase in wealth. Intensiveness of culture, or the total quantity grown by prosperous populations, has been dependent upon the density of population or the number of consumers within reach. The radius of distribution for soft fresh fruits was until recently limited to a land haul of less than forty miles by wagon or a voyage of twenty-four hours by boat. For apples the distances by land hardly reached sixty miles for any considerable quantity. During limited periods of favorable temperatures the steamship might carry apples or citrous fruits and bananas in international trade, but means of distribution were lacking at all ports.

Accordingly the first modern development and intensification of fruit culture for distant trade was the extensive planting in California of fruits for drying. Loaded at first as ship stores, the dried fruits rapidly became cargo and the industry grew virtually world wide in scope. The canning industry and still later the tremendous movement of fresh fruits gave new impetus to the development of this uniquely favored fruit growing region. With climatic conditions such as those near San Francisco Bay, where winter rainfall and summer fog suffice to produce good crops of fruit without irrigation, general freedom from spring frost insures a large proportion of full crop years and absence of rain at the ripening season makes ideal conditions for drying out of doors with a minimum of labor and equipment, Californian preeminence in sun dried fruits was rapidly established and successfully maintained.

The production of fruit in the Rocky Mountain and Pacific coast region of the United States has been the primary cause of American advance in the art of irrigation. Early irrigation was largely a work of necessity, performed by

populations struggling for food supplies. In the far western states the reclamation by irrigation of vast areas for purely commercial exploitation has been stimulated by the profits of fruit growing. These regions produce the apple, pear, peach, plum, prune, fig, apricot, cherry, orange, lemon, grapefruit, grape, avocado, olive, walnut and almond. Except for its fruit growing possibilities this region would have remained predominantly a series of mining, lumbering and grazing areas. Following closely the methods developed here, Australia and South Africa are exploiting specialized fruit areas for international trade. Chile and Argentina are attempting to do likewise.

The history of the potato is even more phenomenal than that of many fruits. Native to the cooler highlands of South America, the potato never comprised the chief food resource of any large native population, but following its introduction into Europe in the sixteenth century it rapidly became a principal food of millions of people. This increased food supply has forestalled famine and made possible much of the increase in European population. But notwithstanding its preeminent importance the potato has never figured largely in European commerce. It is too bulky and cheap to bear rail transportation costs. Water rates permit shipments from the Canary Islands and Jersey, which raise new potatoes for export to the London market.

Until within the last fifty years all vegetable production and most fruit growing were exclusively for the local market. Gradually the industries expanded to supply the nearby demand resulting from the rapid growth of cities. The goal of the early orchardist and gardener was the production of a large assortment of varieties to furnish a salable supply through the longest possible season. Except that cheaper land was available, conditions in the United States were similar to those in most of Europe.

The modern international fresh fruit and vegetable trade depends for its existence on transportation and refrigeration. Even after the introduction of the refrigerator car railroads did not extend the commercial production of fresh fruits very far from the centers of population as long as natural ice had to be obtained at both ends of the run. But the development of mechanical refrigeration and the modern cold storage plant, supplemented by controlled temperatures in the holds of ocean vessels, have made possible the present day fruit and vege-

table industries. The building of the first commercial ice plants in 1886 and 1887 was followed within a year by the first long distance shipments of fresh fruits and vegetables under refrigeration. Transatlantic steamers immediately provided refrigerated space for fresh meats, and as that trade decreased, the increase in fruit exports created a demand for refrigerator space to an even larger number of ports. The fruit business alone led to refrigerator service from Pacific ports through the Panama Canal direct to Europe.

In internal commerce refrigeration has made possible an extension and concentration of berry and bush fruit production far from the larger markets as striking as any aspect of the tree fruit industry. In the United States many thousands of carloads of strawberries are grown on cut over pine lands in Louisiana, on the coastal sands of North Carolina and on the relatively infertile soils of western Tennessee and the Ozarks. These reach all important markets in such volume that the cheapest strawberries of the year in all the country north of the Ohio and Potomac rivers are those which come from a distance and well in advance of the local season. Dewberry production for the east centers in North Carolina. The greatest long distance movement of raspberries is from Puget Sound. The quick freezing process promises to put fresh berries, in small packages, into the hands of every ice cream vendor in the land the year around.

The concentration of production and extent of distribution of vegetables, such as tomatoes and melons, are equally striking. Tomatoes from the west coast of Mexico are sold in all American markets all winter. Cantaloupes and lettuce from Imperial valley, California, monopolize the markets of the country for several weeks. Watermelons from Georgia and Texas reach all American markets.

Communities are almost as highly specialized as are the plantings of individuals. The Wenatchee valley of Washington is almost one continuous apple orchard. For miles the lower Sacramento valley is set almost solidly to Bartlett pears. In central Georgia it is the peach, on Cape Cod the cranberry.

An increasing number of examples of a similar regional specialization are to be found in countries outside the United States. It is the banana trade which makes Central America important to the rest of the world. Railroads in producing areas and ocean steamship lines are

dependent upon the banana for their existence. Special facilities for transporting and ripening are provided in consuming countries. Every step of the process from the clearing of the tropic jungle to the jobbing of the delivered product in markets on other continents is controlled by a few gigantic organizations with national and international political and economic influence. The grape and wine industry of the Rhine, the lemons of Sicily, the oranges of Spain, the Zante currants (small raisins) of Greece, the figs of Smyrna—each illustrates a localized fruit interest of international importance, and each is a chief source of income for a region.

The mixed orcharding and vegetable growing of northern Europe is yielding slowly to the tendency toward specialization. Until recently limited national domains, with the difficulties which beset shipments of perishables across numerous boundary lines and through a maze of customs regulations, have checked free competition between producing areas and the grower has not been compelled to confine his production to fruits in which he has a natural advantage over other growers. But already French lettuce, Italian cauliflower, and tomatoes from Campania and Emilia are seen regularly in British markets and to some extent in Germany. England imports onions from Spain from May to February, from Egypt in the spring and from Holland and Germany in the summer. Heavy shipments of apples from both the United States and Canada are made to England every year. South Africa supplies soft fruits. Spain, the United States and the West Indies supply large quantities of citrous fruits, with Palestine as a new competitor. London asparagus comes from Worcestershire, cherries from Kent and currants from Norfolk. Paris draws many of its vegetables and fruits from Vaucluse and Brittany; Normandy sends apples, Beige near Bordeaux sends artichokes, Lalande near Toulouse sends spinach. Spain sends plums and, with Italy, beans and potatoes.

Those markets which are open to American competition are in self-defense attempting to standardize their product and adopt trademarks and modern packing methods. Holland has been most successful in cooperative marketing. Belgium has also attempted to reorganize its marketing technique, but until recently Belgian cooperative societies buying fertilizers and other supplies have been more successful than selling societies.

Common interests and problems, arising out

of long time investments, seasonal needs for labor and packing facilities, and a common market have in the United States also led to cooperative effort and organization among fruit growers, from the cranberry growers of Cape Cod to the apple growers of the Pacific northwest and the orange growers of southern California and of Florida. Local cooperative effort is almost everywhere successful in fruit regions, but an element of monopoly seems to be a prerequisite to large scale cooperative marketing. Geographic limitation of orange and cranberry production affords the necessary monopolistic possibility. Deciduous fruits are grown so widely and fall into so many naturally competitive districts that cooperation has thus far been strictly local. The organization of growers into large units for purchasing supplies as well as for marketing crops has forced the consolidation of competing agencies into larger units. As a result the entire fruit growing community is effectively represented by a limited group. The marketing of the crop is accomplished with less loss and waste than is generally believed. Few industries in the United States are better represented before state and national legislative or official bodies, a fact which largely explains why fruits enjoy such marked consideration by lawmaking bodies and are so very generally sheltered by protective tariffs and other trade barriers.

In earlier periods the growing of fruits and the growing of vegetables were closely related, the two often coming from the same farms in the same wagons to the same markets. As their production has been freed from confinement to suburban lands by the development of quick transportation and refrigeration, the separation of fruit and vegetable growing into two distinct industries has become more marked. The channels of distribution, particularly of retail distribution, remain the same, but methods and conditions of production present striking contrasts. This is especially the case in the United States.

Orchards represent a long time investment; they require progressive and intelligent care. Moreover, fruit lands abound in attractive home sites. Fruit areas therefore usually contain a highly permanent farm owning class. The modern fruit industry has undergone a marked process of mechanization of production as well as of transportation and distribution. Apple cultivation, for example, is done by the tractor with extension harrows which operate under low, spreading trees. Prunings are burned in a sheet

iron furnace on wheels drawn up and down the rows. Power sprayers with perforated nozzles drive a fine mist through the trees. Thinning the fruit, propping or bracing overloaded trees and picking the crop are among the few remaining hand operations. Fruit is trucked to packing houses at high speed. It goes through an acid bath, thence perhaps through a mechanical drier; then over a grading table to be distributed through a machine which separates sizes with great accuracy ready for the packers. Mechanical conveyors bring empty packages and carry away those which are filled. A mechanical device applies the lid to boxes with a bulge pack.

The most highly specialized vegetable areas have, in contrast, tended steadily toward the development of tenancy and absentee landlordism. Extensive and specialized vegetable production has led to the drainage of vast swamp or muck land areas now given over wholly to onions, celery and other so-called muck land crops. The development of these lands has required much capital, and they have a high rental value because of their large annual return; but there is nothing to commend them to the capitalist or his family as places of residence. They are low and flat, usually with a long muddy season and with water supplies of questionable quality. The inevitable result is tenantry by operators who are held to the soil only by the hope of quick and substantial gains. These tenants are necessarily financed by the landlord or a marketing agency. No local bank can afford to finance large scale local vegetable operations. A single crop often requires an outlay about equal to the value of the land on which it is grown. The tenant will remain on such land only until he is able to establish himself elsewhere. A single bad year may provoke a large exodus. Meantime large numbers of laborers of the least skilful type must be imported and released as needed for specific operations. The financing agencies must often attend to this. Obviously such a population has little stability; with only an annual interest in the crop and no permanent stake in the community tenants have never yet formed effective cooperative groups.

Not all large scale vegetable farming is on muck land, but in the irrigated deserts and alluvial bottom lands so large a part is conducted by tenants or by the holders of small equities who are dependent upon distributors for their operating capital that effective and permanent cooperative organization has been found impracticable. A few potato growers' exchanges

have survived for several years and operate on a large scale; but these potato regions stand midway between orchard and muck land districts, the crop being grown almost entirely by permanent landowning farmers who are largely able to finance their own operations.

The specialization of fruit and vegetable growing has given rise to a labor problem of some magnitude. Many operations, particularly in fruit production, require a large supply of relatively skilled labor, but the demand is highly seasonal. In the United States thousands of laborers migrate with the fruit and vegetable seasons, often operating through nearly 1500 miles of latitude. An increasing number of these migratory workers are Mexicans. In Europe the beet sugar harvest draws laborers from as far as Poland. The problem, however, is of less magnitude for the fruit and vegetable industries of Europe as a whole than for those in the United States. The seasonal and migratory character of such labor militates against effective trade unionism, and the securing of satisfactory conditions for these workers is a problem which still awaits solution.

FRY, ELIZABETH GURNEY (1780-1845), English philanthropist and prison reformer. Elizabeth Gurney was the daughter of a wealthy Quaker banker and married a London merchant. Her husband later suffered economic reverses which compelled her to manage her own household of many children but did not deter her from continuing her reformist activities. Early in life she had undergone a deep religious experience and had become a preacher. In 1813 she began her practical work in prison reform by a visit to Newgate prison in London. She was horrified by the usual spectacle of the herding together of the accused, debtors and criminals, by the unspeakable filth, the lack of decent clothing, the scanty and miserable food and the presence of small children in prison with their mothers. Mrs. Fry raised money to buy clothes for the women inmates, to establish a school, to institute Bible reading and religious instruction and to provide regular preaching. In 1817 she formed the Association for the Improvement of Female Prisoners in Newgate. She was permitted by the prison authorities to work out a system of prison discipline which embodied the separation of the sexes, the differentiation and classification of types, female supervision for women inmates, religious instruction and prison

employment. The results achieved established Mrs. Fry's international reputation. She extended her activities to other British penal institutions and sought to influence the government to reduce the horrors in the treatment of convicts deported to Australia. Later she traveled extensively on the continent, visiting prisons in France, Prussia, Switzerland, Belgium, Holland and Denmark. Mrs. Fry also established shelters and soup kitchens for the paupers and beggars in London.

FUCHS, ERNST (1859–1929), German jurist. Fuchs may be considered the founder of the so-called free law movement in Germany. He became the champion of a liberal, sociological approach to law when during the first two decades of the twentieth century he published a series of books which attracted wide attention: *Schreibjustiz und Richterkrönigtum* (Leipzig 1907); *Recht und Wahrheit in unserer heutigen Justiz* (Berlin 1908); *Die Gemeenschädlichkeit der konstruktiven Jurisprudenz* (Karlsruhe 1909); and *Juristischer Kulturkampf* (Karlsruhe 1912). In all these works Fuchs contended that juridical theory and practise in Germany had become antiquated and senile and needed rejuvenation at its head and in its members. He therefore preached a "juridical modernism" and a juridical *Kulturkampf* against the principal evils of his day in the administration of justice. These evils lay for him in the prevailing habit of "constructionalism." He meant thereby that both in juristic literature and in judicial decisions conclusions were based not on the sociological requirements of life, but upon mere intellectual concepts. Since he believed that the exaggerated tendency toward a purely conceptional treatment of law had been originated by the school of Roman law predominant in Germany in the nineteenth century, he spoke of a war against "pandectology." The term cryptosociology, also coined by him, has become especially famous. It signifies a method by which a decision is reached on equitable grounds, without these being openly acknowledged; the sociological contents are hidden behind forced logico-constructivist forms.

Throughout his controversies Fuchs, who was not a professor but a practising attorney in Karlsruhe, proved himself an important figure in contemporary life. He stood within the current of a philosophico-historical development which others have advocated under the term *Interessenjurisprudenz* or *Freirechtswissenschaft*. Yet despite the many who shared his views Fuchs always preserved his individuality. Lacking the gift of establishing a coherent legal system he devoted himself to casuistry and especially directed his biting criticism against many decisions of the German Supreme Court. The tone of his polemical writings was frequently stinging, but for this very reason they had a stimulating effect. The manifest growth of the sociological spirit in present day German legal practise is to be attributed primarily to the work of Fuchs.

FUEROS. *See* CUSTOMARY LAW; CIVIL LAW.

FUETER, EDUARD (1876–1928), Swiss historian. Fueter studied at Basel and Berlin. He lectured on modern history in the University of Zurich from 1904 to 1921 and acted as political editor for twelve years on the *Neue Züricher Zeitung*. He was a tireless investigator, a man of many sided culture, wide knowledge of languages and a thoroughly modern point of view in historical interpretation. His chief works are *Geschichte der neueren Historiographie* (Munich 1911, 2nd ed. 1925), the first history of general historiography and a valuable handbook both as to facts and method, in which the epochs of rationalism (humanism, Renaissance, Enlightenment) are treated with special acumen; *Geschichte des europäischen Staatensystems von 1492–1559* (Munich 1919), splendidly arranged, modern in conception, with great reserve in the expression of political views; *Weltgeschichte der letzten hundert Jahre, 1815–1920* (Zurich 1921; tr. by S. B. Fay, New York 1922), a less important work which has been much criticized, although it is a real universal history with an extensive treatment of America and Asia; *Die Schweiz seit 1848, Geschichte, Politik, Wirtschaft* (Zurich 1928), the best work on recent Swiss

history and the political and economic democracy of Switzerland, with much emphasis upon sociological and economic points of view. In addition Fueter published a number of smaller studies on the fifteenth and sixteenth centuries and displayed a wealth of critical activity in newspapers and other periodicals. In all his works he evinced a very strong interest in and understanding of the Romanic and Anglo-Saxon characters and achievements; his point of view as a historian was west European but in all his works he was eminently universal in outlook, geographically and actually. He died just as he was preparing to write a handbook of modern history for American universities; at that time Harvard University was to have called him to the chair of European history.

EMIL DÜRK

FUGGER FAMILY. The family fortunes of these famous south German capitalists of the Renaissance period may be traced back to about 1380, when Hans Fugger left his Swabian village, Graben, and settled in Augsburg. Probably he worked there as a mere master weaver until the expansion of fustian weaving in south Germany offered an opportunity to his commercial talent. While many of his fellow craftsmen in town and country were becoming more and more dependent upon the Augsburg merchants who controlled the importation of the raw material from Venice and marketed the finished cloth, Fugger rose to the rank of merchant himself. He imported his own cotton and sold his own fustian, and gradually began to dispose of the products of other less enterprising weavers as well. He may also have dealt in other wares which figured in the German-Italian trade. Certainly such transactions were carried on by his two sons, one of whom, Jacob I (1407?-69), founded the branch of the family known from its coat of arms as the Fuggers of the Lily. With this branch the future mercantile history of the family is associated.

Jacob I's son, Jacob II (1459-1525), or "Jacob the Rich," stands in European economic history as the outstanding genius of the early capitalistic period. An apprenticeship served in Venice, where he became permeated by the spirit of economic individualism and rationalism of Renaissance Italy, and his inheritance from his father and two elder brothers, Ulrich (1441-1510) and George (1453-1506), whose mercantile exploitation of the wealth of south Germany had already broken the path for his far more rigorous

exploitation of these resources, partially explain his amazing success. But they count for less in the reckoning than Jacob's innate capacity and univalent purpose to "go on making a profit as long as he could." It was Jacob who more consistently, boldly and ingeniously than any of his relatives developed the unique organization of the Fugger business. Although he himself had no children, his plans were laid with a view to the concentration of the family wealth through succeeding generations in the hands of those members who would employ it for the creation of new wealth. The principles which guided him as well as the devices he contrived to put them into effect are summed up in his last will, made a few days before his death. The partnership was to be restricted to male representatives of the family in the direct Fugger line, and neither outsiders nor relatives by marriage could be admitted; there was to be no dispersal of capital through the withdrawal of large sums by female heirs or others not participating directly in the partnership; none but the ablest members of the family were to have a share in the administration of the business.

In the form in which it crystallized under Jacob II the Fugger firm combined the three activities of international merchant, banker and industrial entrepreneur. As the primary mercantile concern of the family Jacob established metals in preference to textiles, which from the time of Hans had engaged the attention of his ancestors; the spice trade which in his day was tempting other famous mercantile firms in south Germany, such as the Welsers, he usually avoided as too speculative. The principal metals dealt in by the Fuggers were the silver and copper of the Tyrol and Hungary—the two most productive areas for these metals in the world until the middle of the sixteenth century—and Spanish silver and quicksilver. In return for large loans to the reigning princes, particularly the Hapsburgs, the Fuggers received monopolies in the purchase of ore. Thus by the same contract they became royal creditors and controllers of the ore trade; the profits reaped were proportionate to the dexterity displayed. From their interest in regulating the sale of ore they were led gradually into investing capital in its production until finally they assumed the actual ownership and direction of the mines and became the prototypes of modern captains of industry. The more their capital was absorbed by mining, the more reason they had to retain and augment the emperor's favor or protection; and since their

money was always needed by the Hapsburgs they became constantly more deeply involved in financial transactions with the imperial family. The consistency and effectiveness with which they placed their financial resources at the disposal of Maximilian I, Ferdinand I, Charles V and Philip II have perhaps never been equaled by any other mercantile house in the service of royalty—even the house of Rothschild not excepted. For decades Jacob Fugger was also an outstanding financier of the popes. The mightiest supplicant for his money could not win his assistance without offering at least ample security; but Jacob took still further precautions to insure himself against royal insatiability by investing a considerable portion of his wealth in real estate, partly urban but mainly rural. This property, the most valuable constituents of which were the great imperial domains of Swabia, became the nucleus of a family entail which Jacob designed to be held in common by the active members of the business and to be inalienable by them. When Jacob died in 1525 his firm was the wealthiest then existing. From a little over 50,000 Rhenish (gold) guildens in 1494 its capital had swollen to more than 2,000,000; an immense sum considering that the Rhenish gold gulden had a gold content approximately equivalent to that of two dollars and a purchasing power of over ten times that amount.

Jacob was succeeded as head of the firm by his nephew, Anton (1493–1560), under whose leadership its capital and trade continued to grow in volume. At its peak in 1546 the business property of the firm amounted to almost 5,000,000 Rhenish gold guildens. Nor was Anton inferior to his uncle in general influence. The money which Jacob had extended on behalf of the Hapsburgs to the electors of the Holy Roman Empire had made possible the succession of Charles V as emperor in 1519; Anton's money permitted the Hapsburgs to prosecute the Schmalkaldic war and thus became a decisive factor in the course of the German Reformation. It was to Anton's counting house that the Spanish and Austrian Hapsburgs looked for their strongest financial support in all their *grosse Politik*. Nevertheless, before the middle of the sixteenth century the company had lost the internal solidity which it had possessed under Jacob. The truth was that in spite of his luminous role in European finance and politics Anton lacked his uncle's genius for business. In the end he found himself powerless to stem the flood of the Hapsburg demands for money or to offset the outflow by strengthening

his trade in commodities. As a consequence after his death, when control of the firm had passed to his son Markus and other members of the family, the Fuggers lost most of their wealth in the great national bankruptcies—particularly the Spanish and Dutch—of the sixteenth and seventeenth centuries. In the latter century their commercial activity ceased. What remained of their wealth was chiefly the landed property, which Jacob Fugger had rendered immune to the vicillations of mercantile and financial fortune.

FUKUZAWA, YUKICHI (1834–1900), Japanese educator, publicist and reformer. Fukuzawa was born of a samurai family and like all such youths in feudal days was trained in the Chinese and Japanese classics until his twentieth year. In 1854 he went to Nagasaki—which was the one port open to the Dutch, the only foreigners at that time permitted to trade in Japan—to study the Dutch language, which he thought the key to western civilization. In 1858 Fukuzawa went to Tokyo (then Edo), where he taught Dutch, but soon realized that English was a more important language and began to study it. In 1860 he went to San Francisco as an attendant to the commander of the first Japanese frigate to cross the Pacific and brought back to Japan the first copy of Webster's dictionary to enter that country. Shortly afterward he compiled and published an English-Japanese dictionary. In 1861 he served as interpreter to a shogunate mission which visited Paris, London, Berlin and St. Petersburg, and in 1866 he

published the famous *Seiyo jijo* (Western conditions), a description of what he had observed, written in a style which could be understood even by the masses. In 1867 he accompanied a mission sent to Washington to buy a warship and guns and returned to Tokyo just after the shogun had abdicated in favor of the emperor.

In 1868 he opened in Tokyo the Kei-O-Gi-Juku, the nucleus of a great educational institution consisting of primary schools, high schools and colleges, now commonly called Keio University, which has produced many progressive leaders in politics, finance, business and journalism. Before his classes Fukuzawa translated orally the works of Adam Smith, Mill, Spencer and Darwin, his favorite authors. He ridiculed Confucian politico-ethical concepts and urged the substitution of western ideas. In 1882 he launched the *Fiji shimpō*, a non-partisan daily newspaper with a political, economic and social educational policy. For many years this paper exercised great influence. Fukuzawa wrote numerous books interpreting western civilization and advocating the rehabilitation of Japan on progressive lines. He was frequently invited to become minister of education but preferred to work through his school and his writings without the interference of the bureaucracy or aristocracy. He was the foremost representative in his fields of the generation of leaders who first undertook the making of the new Japan.

FULL FAITH AND CREDIT CLAUSE. The provision in article iv, section 1, of the Constitution of the United States, commonly referred to as the full faith and credit clause, is as follows: "Full faith and credit shall be given in each State to the public acts, records, and judicial proceedings of every other State. And the Congress may by general laws prescribe the manner in which such acts, records, and proceedings shall be proved and the effect thereof." The clause was derived from the provision in the last paragraph of article iv of the Articles of Confederation, which provided: "Full faith and credit shall be given in each of these states to the records, acts and judicial proceedings of the

courts and magistrates of every other state." Since the clause was thus limited to the "records, acts and judicial proceedings" of the courts, the Congress of the Confederation was empowered neither to provide a method of authentication nor, as was said in the case of *M'Elmoyle v. Cohen* [38 U. S. 312, 326 (1839)], to "legislate upon what should be the effect of a judgment obtained in one state in the other states." Prior to the adoption of this provision the courts of the American colonies seem to have regarded the judgments of courts of sister colonies as foreign judgments in default of provision to the contrary, such as was enacted by the provincial Act of 14 George III, c. 2, for the province of Massachusetts Bay.

The brief discussion of the full faith and credit clause in the Constitutional Convention indicates that the original purpose was threefold: to prevent repetitious litigation in a federal system of justice, to secure uniformity in the proof of official records and to make possible the federal regulation of interstate rights, whether arising under legislative or executive acts or as a result of judicial proceedings. By the act of 1790 the first Congress of the United States provided for the authentication of state legislative acts and judicial records and further enacted that judicial records and proceedings, duly authenticated, should "have such faith and credit given them in every Court within the United States, as they have by law or usage in the Courts of the state from whence the said records are or shall be taken." By the supplementary act of 1804 the provisions of the act of 1790 were extended to the public acts, records and judicial proceedings of the territories of the United States and countries subject to its jurisdiction. The latter act was held in the case of *Embry v. Palmer* [107 U. S. 3 (1882)] to be an exercise of the general judicial power of the United States government, complementary to the provisions of the full faith and credit clause.

The fact that Congress has thus far not regulated the effect of other than judicial records and proceedings has restricted the application of the full faith and credit clause primarily to judgments of courts within the United States or its territories. The principal questions involved relate to the effect of given judgments of a state in other states of the United States, to the defenses available in actions on a judgment of a sister state, to the application of the full faith and credit clause as between state and

federal courts and to the mode of enforcing sister state judgments.

For a brief period it was the prevailing view that the full faith and credit clause and the act of 1790 provided only for the authentication of judgments of sister states and did not give them a more conclusive effect than was given under the common law doctrines of the time to foreign judgments, these being regarded as no more than *prima facie* evidence. In 1813, however, the leading case of *Mills v. Duryee* [11 U. S. 481 (1813)] decided that "the record duly authenticated shall have such faith and credit as it has in the state court from whence it is taken." The law was thus settled that if a judgment is conclusive in the state of its rendition similar effect is to be given it in courts of other states. The accepted view, however, is that it is conclusive only as evidence; therefore a state court is not required to take judicial notice of the fact that there has been a prior judgment in the court of another state on the same cause of action unless it is pleaded as a defense. A more important result is that, because of the artificial but necessary distinction which is drawn between remedies and rights, the mode of suing upon the prior judgment and the methods of execution available are determined by the law of the forum. Consequently, the actual results in the enforcement of a state judgment may vary in other states from those in the state of its rendition.

The limitations which have been imposed by judicial interpretation upon the application of the full faith and credit clause to state judgments are chiefly the effect of other legal doctrines. The most important is that the court of the state rendering the judgment must have jurisdiction; by the Fifth Amendment to the Constitution the United States, and by the Fourteenth the states, are prohibited from depriving any person of life, liberty or property without due process of law. Consequently, unless there be in a personal action personal service or the equivalent and in an action *in rem* jurisdiction of the subject matter, the judgment of a sister state is not constitutionally valid and therefore is not entitled to full faith and credit. And, as was decided by *Thompson v. Whitman* [85 U.S. 457 (1874)], the recital of jurisdictional facts in the record of a state judgment does not preclude evidence to disprove them in the court of another state. Secondly, under the unsatisfactory doctrine as to the remedial character of statutes of limitation it was decided in 1839 that the period within which action may be brought on a sister

state judgment may be more limited in other states than is provided by the state of its rendition (*M'Elmoyle v. Cohen*). Thirdly, the doctrine that actions arising under penal and other administrative statutes are not transitory has led to the rule that a state judgment on a "penal" cause of action is not entitled to full faith and credit [*Wisconsin v. Pelican Ins. Co.*, 127 U. S. 265 (1888)]. Fourthly, as a result of the doctrine that foreign corporations are not "citizens" a state is not required under the full faith and credit clause to entertain an action by a foreign corporation on a sister state judgment [*Anglo-American Provision Co. v. Davis Provision Co.* no. 1, 191 U. S. 373 (1903)]. It should be added that to be given full faith and credit the judicial proceeding should be final under the laws of the state in which it is had.

As to the recognition of state judgments in the federal courts and vice versa, the broad terms of the act of 1790 extend full faith and credit to state judgments in actions upon them in the federal courts. Conversely, the state courts have been required by judicial interpretation of the act of 1804 to give full faith and credit to the judicial proceedings of federal as well as territorial courts.

Under the principles of the common law the jurisdiction of a court is territorial and its judgment has no effect of record outside the jurisdiction. As a result, a judgment can be enforced in other jurisdictions only by action brought upon the judgment. This requirement generally prevails in England and the United States as to the enforcement not only of foreign judgments but also of interstate and intercolonial judgments. Australia, however, which has been strongly influenced by the American constitution in the drafting of its own, has incorporated in it an improved version of the full faith and credit clause providing a more effective federal mechanism for the interstate enforcement of rights. By the Service and Execution of Process Act, 1901, amended in 1912 and known as the Service and Execution of Process Act, 1901-1912, which was enacted in pursuance of the constitution of the commonwealth, provision was made not only for the registration of judgments duly rendered in any state with courts of similar jurisdiction in other states in which execution is desired, but also for the service of the civil and criminal process of each state throughout the commonwealth. The advantage of the latter provision is that it tends to fix litigation in the state where the subject matter

is situate or the cause of action accrued instead of where the defendant happens to have been served and thus to eliminate *ab initio* many possible conflicts of laws. The authorization of the direct execution of judgments, a method of enforcement familiar in civil law countries, largely obviates the delay, expense and difficulties of obtaining jurisdiction over a judgment debtor which are inherent in the more usual English and American practise.

It should be noted, however, that the hardship involved in requiring that a judgment debtor should be personally served in an action brought to enforce a foreign judgment has been somewhat alleviated in a large number of American states by the enactment of attachment statutes which provide for the enforcement of debts without personal service, if property of the debtor can be attached within the jurisdiction. The interesting suggestion has been made that Congress might even under the present full faith and credit clause constitutionally provide by new legislation for the registration of judgments in other states as well as for service of process throughout the Union.

Although the full faith and credit clause has been primarily applied to sister state judgments, there is some indication of a tendency in certain types of cases to extend its application by judicial interpretation to state statutes. Thus it has been said that a statute defining the rights and liabilities of members in a fraternal association [*Royal Arcanum v. Green*, 237 U. S. 531 (1915)] and the laws of the state in which a life insurance policy was contracted [*Aetna Life Ins. Co. v. Dunken*, 266 U. S. 389 (1924)] were entitled to full faith and credit. It is probable that these cases are to be explained by the desire for a certain degree of federal control in corporation and insurance cases.

These cases have led to the suggestion that a considerable degree of uniformity in the solution of the troublesome problems of the conflict of laws could be secured by a more liberal judicial construction of the full faith and credit clause in conjunction with the due process clause. The alternative suggestion that by federal legislation interstate service of process could be authorized and the conflicts of laws resolved by "a code of uniform national laws" accord more directly with previous trends and with the powers granted to Congress to prescribe the effect of state acts and judicial proceedings. Thus far tendencies toward uniformity have chiefly taken the form of the enactment of uniform state laws

and more particularly of direct federal legislation in important fields of commercial law, e.g. bankruptcy, interstate commerce, and so on. In the absence of federal legislation as to the general law of conflicts the courts have been reluctant to extend the full faith and credit clause beyond the narrow legislative definition in the act of 1790. Indeed, in certain fields, such as divorce, the jurisdictional requirements under the clause have been the occasion of a restrictive interpretation which has led to confusion. In consequence, the application of the full faith and credit clause has been scarcely more effective than the very similar doctrines independently developed by the courts as to foreign judgments; nor can it be said to have been substantially utilized as a means of securing uniformity in the enforcement of interstate rights.

FULLER, (SARAH) MARGARET (MARCHESSA D'OSSOLI) (1810-50), American literary and social critic and feminist. Unusually erudite and self-reliant, Margaret Fuller early sought for some suitable sphere of activity. To support herself and her family she at first taught school, for a time under Bronson Alcott; from 1840 to 1842 she edited the *Dial* with her friend Emerson as nominal joint editor, at the same time conducting in Boston classes for women, called conversations, which attracted the attention of the intellectual world. In 1844 she joined the staff of the *New York Tribune*, for which she wrote critical reviews and general articles and for which she acted as correspondent while in Europe from 1846 to 1850.

Although interested in all problems of social reform Margaret Fuller was especially occupied with the question of woman's place in society. She did not believe that women's talents are

necessarily the same as men's, but she maintained that women could not adequately develop their peculiar gifts until all artificial restrictions were removed and for that reason argued that women should be allowed to enter upon all forms of activity as freely as men. Both her writings and her example were influential in the feminist movement. In her writings on this question and on all social problems her transcendentalist tendencies are discernible in her emphasis on individual improvement rather than on collective activity.

In Europe her reputation, based especially on her pioneer study, *Woman in the Nineteenth Century* (New York 1845), brought her wide intellectual contacts. In England she had met Mazzini and when she went to Rome, where she remained for more than three years, she became deeply interested in the cause of Italian independence. During the siege of Rome she served as a nurse. There she married the Marquis d'Ossoli, a youthful participant in the cause. In 1850 she and her husband and child were drowned on their way to America.

FUNCTIONAL REPRESENTATION. The term functional representation is used in political science to describe the representation of specific economic groups, such as the workers or the employers in particular industries or both workers and employers together, the members of a profession and so forth. It must be distinguished from representation by class or rank or wealth, although in some cases the two groups may coincide. A distinction may also be drawn between conferring on special groups or persons the right to vote with the general body of citizens, by reason of the fact that they belong to a particular category, and giving separate representation to that category. To the question whether the purpose of representation by economic groups is to represent a status or an industry or an occupation there is no single answer which will fit all the facts and theories. Historical analysis increases the difficulty of clear definition.

In the ancient world there was no representation of any sort, functional or otherwise. The Athenians believed that the whole life of a citi-

zen must be dedicated to the service of the state, and they would have regarded the fulfilment of the civic obligation through the occasional exercise of the right to vote as a travesty of political life. Nevertheless, Solon organized the constitution of Athens on the principle of dividing the population into four classes according to property and distributing the various public offices among three of the classes in proportion to the value of their ratable property. There is here a rudimentary indication of the conception that government should be representative of certain economic interests.

The great political invention of representation first appears in a coherent form in the thirteenth century, although the notion of the representation of a community by some of its members may have been much older. It existed as an important part of the organization of the friars, and particularly of the Dominican order, as early as 1221. Later in the same century the idea was consciously utilized in the formation of the early English parliaments. Thus in 1254 in the king's absence the regents summoned a great council to Westminster to which each sheriff was bidden to send "four lawful and discreet knights from your county whom the county shall have chosen for this purpose." At the famous Model Parliament of 1295 the bishops and abbots were summoned by name, but the lower clergy were represented on a definite electoral plant. By the end of the century Parliament had taken shape as a national assembly consisting of clergy, barons and commons. There was a rough correspondence between these classes and the threefold division of society into those who pray, those who fight and those who work, which in one form or another can be traced back to the ancient world. But recent historical research has discredited the idea that the early English parliaments were deliberately organized on the basis of three estates as such. With the gradual withdrawal of the clergy Parliament instead of being an assembly of the three estates became an assembly of lords, spiritual and temporal, and commons. The commons were probably the organized bodies of freemen in the shires and towns; they represented the "poor folk of the land" and were elected in the full county court.

The idea of embodying representatives of the priestly, military and plebeian orders in a parliament or council was prevalent throughout western Christendom during the Middle Ages. The actual institutions which were created varied from country to country. In France, for example,

meetings of the Estates General were summoned by the king at irregular and often infrequent intervals from 1302 onward. The Estates General was an assembly of barons, clerics and bourgeoisie, the last named being represented by elected deputies. Each of these three orders or estates had its own deliberative chamber for general decisions, and business was transacted on the basis of one vote for each order. This system prevailed until 1789, when the third estate not only demanded one vote for each member but with the support of the parish priests declared themselves a National Assembly.

All this relates to central government. In the Middle Ages, however, local government was in many ways more important than the central power. Municipal administration was for centuries inextricably bound up with the guild system. The governing body of the borough or corporation was largely composed of members of the various merchant and craft guilds situated in the town, and there was often a deliberate intention of making the town council representative of the different guilds.

In the centuries which followed the Middle Ages a gradual change took place from a stratified society consisting mainly of orders to one consisting mainly of individuals. Democracy everywhere relies on the representation of individuals as such, an essentially atomistic conception of society which would have seemed strange indeed to the political thinkers and statesmen of the thirteenth or the fourteenth century. Representation, moreover, has come to mean representation by election. In the Middle Ages there was plenty of representation of classes, orders, occupations, functions, but little in the way of election; in fact, representation did not necessarily imply election until the nineteenth century. Representatives might be chosen by a public officer, by lot, by rotation or by other methods. For the most part also representation was not a right claimed from below but an obligation imposed from above—in the case of parliament, a service required by the king.

When the movement for democratic institutions swept across Europe in the nineteenth century there was no talk of functional representation. It is true that Sir Hugh Cairns asserted in the House of Commons in 1866 that Parliament should be "a mirror, a representation of every class; not according to numbers, but according to everything which gives weight and importance in the world without." But he was a voice crying in the wilderness, for the demand for

popular parliamentary institutions was essentially a demand for the representation of persons in their capacity of individuals. John Stuart Mill in his influential book *Representative Government* (1861) ignored the whole question of functional representation and dealt exclusively with what may be called by contrast territorial representation. Nevertheless, there existed up to the end of the nineteenth century in various countries electoral requirements which had the indirect effect of producing something approaching functional representation. In the Austrian empire, for example, 85 out of a total of 353 members of the lower house of the Austrian Reichsrath were elected to represent the largest landed proprietors, or those most highly taxed, while a further twenty-one were elected by the chambers of trade and commerce either individually or in conjunction with the electoral town district, and various persons in the towns were entitled to vote by virtue of the office or position which they held.

The conception of political democracy as a system involving the total representation of isolated individuals grouped into territorial units appeared to be firmly established in parliamentary assemblies all over the civilized world by the end of the nineteenth century. In the twentieth century, however, it has been severely challenged both in fact and in theory in a large number of the leading countries.

The most vehement although incoherent attack before the World War came from the revolutionary syndicalists in France. The main emphasis in the exhortations of Sorel and his followers was laid on the general strike as an instrument of revolution, on the need for violence and the desirability of direct action to secure control by the workers. In all the utterances of the exponents of syndicalism a fundamental distinction is assumed between an economic class and a political party, and there is an underlying disbelief in the method of parliamentary representation.

The immediate influence of revolutionary syndicalism was short lived, as might have been expected in view of its insecure philosophical foundation, the slender intellectual equipment of its exponents and the absence of a constructive program. A more substantial effort to supersede parliamentary democracy was made by the English guild socialists, who put forward a developed scheme for the entire government of political, economic and social life by means of an elaborate series of functional councils.

The starting point of guild socialism is the assertion that the idea of democracy has become entangled with a particular theory of government based on a totally false theory of representation. This false theory is that one man can "represent" another or a number of others and that his will can be treated as the democratic expression of their wills. No man, according to the guild socialists, can represent another and no man's will can be treated as a substitute for, or representative of, the wills of others. True representation is always specific and functional and never general and inclusive. What can be represented is never man, the individual, but always certain purposes common to groups of individuals. It follows naturally from this hypothesis that the theory or the practise of representative government commonly found in legislative assemblies is utterly false and destructive of personal rights and social well-being.

Functional representation in the eyes of the guild socialists is open to no such objection, for it does not profess to be able to substitute the will of one man for the wills of many. In proportion as the purposes for which the representative is chosen lose clarity and definiteness, representation passes into misrepresentation. Thus, they declared explicitly, misrepresentation is seen at its worst today in the omniscient "representative" parliament, which professes to represent all the citizens in all things and therefore as a rule represents none of them in anything. Real democracy is to be found not in a single omniscient representative assembly but in a system of coordinated functional representative bodies. These guilds would represent particular functional groups and would in the last resort be self-governing.

The fatal weakness of guild socialism lies in the overwhelming amount of power it aims to confer on men and women in their capacity as producers. The selfish interests of particular groups of producers are nowhere to be effectively subordinated to the claims of the consumer or those of the general public. The difficulty of carrying on industrial processes under a system in which the workers have supreme control over their own economic activities was demonstrated by the breakdown of the building guilds which were started in England after the World War to give practical expression to the guild socialist creed. Little is now heard of guild socialism. Yet shortly after the end of the war it had a striking echo in Germany, where many leaders of political thought, including especially Walther Rathe-

nau, formulated a political system which bore in many ways a close resemblance to the guild socialist doctrine. It had also a considerable indirect influence in forcing upon the public notice the vital and intimate relationship which normally exists between a functional representative and the rank and file of the functional group, as compared with the frequently remote and apathetic relationship between a territorial representative and his constituents. The effect of this was shown by the admission on the part of such severe opponents of guild socialism as Sidney and Beatrice Webb that in a socialist commonwealth the democratic organization of society must spring from at least three distinct foundations: man as producer, as consumer and as citizen, with each of these functions adequately represented in its appropriate institutions.

The radical thinkers to whom reference has been made were only voicing in an extreme form the dissatisfaction with parliamentary institutions widely felt among practical politicians and political scientists. The vast increase in the scope of government, its extension into economic fields and the complexity of public administration have made both citizens and representatives aware of the shortcomings of election on a territorial basis. The huge increase in the size of modern electorates (especially where women have been enfranchised) has destroyed any real contact between the parliamentary representative and the voters who elect him. The difficulty of the problems with which modern states are confronted has made it seldom possible for persons who are not experts or prepared to specialize to be able to contribute usefully to parliamentary discussion. The close relation between central and local government on the one hand and industry, agriculture, commerce and finance on the other has produced a clear realization of the dominant part played by economic interests in political life, and a demand for representatives who can bring to the legislative assembly knowledge of industry, of labor problems, or some other kind of special experience. The impact of science, education, public health and other social services on public administration has intensified the demand for the introduction of *expertise* into representative institutions.

It is scarcely surprising in view of all these forces working in the same direction to find in a number of countries a well marked tendency toward either the supplanting of the parliamentary idea altogether or the supplementing of it by various devices for securing the representa-

tion of significant functions. In the Soviet Union the principle of geographic representation has been entirely replaced by the system of soviets, or councils, of workers' representatives.

Scarcely less significant is the Fascist regime in Italy. There, as in the Soviet Union, territorial democracy has been completely displaced. An attempt is being made to construct a parliamentary system based entirely on functional representation. The corner stone of the Fascist edifice is the syndicates which are officially authorized to represent the various occupational groups of workers and employers—one for each group. These syndicates are built up into national syndicates, the national syndicates into national federations embracing both workers' and employers' associations, and the national federations are in turn united in national confederations of Fascist syndicates. There is also a complex arrangement of provincial unions. Under the present law 800 delegates to the reconstructed Parliament are designated by the syndicates, and 200 candidates are proposed by various cultural, educational, charitable or propagandist associations. The list of delegates is then revised by the Fascist Grand Council and finally submitted en bloc to the electorate, which comprises all those paying syndicate contributions together with certain other groups. This constitution clearly displays the corporative state, with such representation as exists based entirely on functional activity.

In a number of countries where democratic institutions based on territorial representation have been maintained the idea of functional representation has been worked into the traditional fabric. In England numerous instances are to be found. The Education Act of 1921 requires every local education authority to have an education committee which must contain persons of experience in education and persons acquainted with the needs of various kinds of schools. These persons are to be nominated by outside bodies. The National Health Insurance Act of 1924 embodies a scheme for the functional representation of specific interests, such as the medical profession and the suppliers of drugs, medicines and appliances, in the various committees charged with administering the system of social insurance. The minimum wage legislation enacted in the Trade Boards acts of 1909 and 1918 contains analogous provisions.

A more striking example is to be found in Germany. Under article 165 of the constitution of 1919 workers and salaried employees for the

protection of their social and economic interests have a right to be legally represented in workers' councils established for individual undertakings, in district workers' councils grouped in connection with economic districts and in a federal workers' council. District economic councils and a federal economic council are also called for by the constitution in order to combine the workers' councils with the employers and other classes of the population. This article has been in part implemented by the German Works Council Act.

Article 165 goes on to stipulate that all bills of fundamental importance dealing with matters of social and economic legislation shall before being introduced be submitted by the federal government to the federal economic council for its opinion. The federal economic council shall have the right itself to propose such legislation, which the federal government is bound to introduce in the Reichstag whether it agrees with it or not. A provisional federal economic council, not based on district economic councils, was called into life by a decree of May 4, 1920, and has been functioning since then. Its constitution has been considerably modified by later decrees.

In the international sphere numerous instances of functional representation are also to be found. For example, the conferences of the International Labour Office are attended by persons chosen to represent the workers' and employers' organizations as well as by government representatives. Such bodies as the International Postal Union clearly have a functional aspect.

From what has been said it can be seen that since about 1910 there has been an almost continuous reaction at work against the system of parliamentary democracy based on territorial representation, which in the nineteenth century succeeded the legitimist principle of monarchical rule in most of the civilized countries of the western world. That reaction has in some cases consisted only of an intellectual revolt, as in the case of revolutionary syndicalism and guild socialism; in others it has taken practical shape, as in the case of communism and Fascism. In every instance, associated with the challenge to territorial representation and indeed forming an integral part of it, is a scheme for some alternative form of representation based on function. The idea of functional representation has been definitely introduced in greater or less degree in the political institutions of a number of important states, including Germany, the Soviet Union, England, Italy, France and Jugoslavia.

With so much experimentation in process it is

scarcely possible at this stage to arrive at any final and complete evaluation of the merits of the principle. But certain conclusions definitely emerge. The first of these is that the vigor with which functional representation has asserted itself in the past two decades is a symptom of the dissatisfaction with which territorial democracy is regarded in many quarters. It is abundantly clear that the relatively simple legislative and administrative institutions which sufficed when the main work of government consisted of the exercise of police powers are inadequate to carry successfully the immense burden of positive duties and services which governments in all countries are now expected to provide. It is certain therefore that large reforms and innovations in the structure and technique of democratic institutions may be expected in the near future as regards both legislation and administration. It must not be assumed, however, that the imperfections of existing institutions are necessarily due to the fact that they are based on territorial representation. This is not true in any substantial sense.

The next fact which emerges is that none of the advocates of functionalism has devised a satisfactory method of allocating due weight to each interest to be represented. No objective standard exists by which "due" weight can be measured. The importance of a function obviously does not depend on the number of persons performing it; the medical profession, for instance, has a social importance out of proportion to the numbers engaged in it.

Another formidable difficulty inherent in functional representation is that of determining the functions to be represented. Are industries to be represented as such? Is transport a function? Or are the railways one function and motor omnibus services another? Is the railway industry a single function which includes diverse undertakings such as hotels, restaurants and the repair shops belonging to the railways? Or should the railways' undertakings in each of these lines be represented with the hotel, restaurant and shop industries respectively? Endless problems of this character arise from the lack of clear cut boundaries in economic life.

It is certain that functional representation if extensively introduced everywhere would be destructive of the political party system as it at present exists. But the precise effects in that connection are impossible to predict.

The whole conception of functional representation may be regarded either as a method of

securing expert knowledge in the conduct of public affairs or as a means of obtaining the representation of sectional interests. The former has much to commend it in a world of increasing complexity where vocational qualifications and professional standards are being called for with increasing insistence. There is a growing belief that those who take part in a social or industrial process have something of value to contribute to the discussion of governmental policy where that process is concerned. But it does not follow from this that the reins of government and in particular the control of economic enterprises affected with a public interest ought to be handed over to the representatives of sectional interests. The ultimate limitation to functional autonomy lies in the difficulty of securing a disinterested will in those who represent sectional interests. If the post office were governed exclusively by representatives of the postal workers, it is almost certain that the interests of the consumer would suffer. In a legislative assembly constituted on a functional basis the disposal of a political question of general import such as disarmament would doubtless depend largely on the sectional interests of dominant industrial groups.

It may be inferred therefore that the vital question is the amount and character of the functional representation which is admitted into the governmental system. Functional representatives have, outside Italy and the Soviet Union, been subordinated to territorial representatives by numerical inferiority where both enjoy membership of a single body or assembly or by legal or constitutional differentiation, such as by restricting functional bodies to advisory powers only. The introduction of such limited functional representation may not necessarily have disadvantageous results and may bring a valuable infusion of expert knowledge. On the other hand, if dominance is given to the functional principle, an entirely different situation is produced, the results of which seem unlikely to be favorable.

FUNCTIONALISM is a term which came into the foreground of philosophic discourse in the last quarter of the nineteenth century and has maintained an increasingly strong position there ever since. It sums up and designates the most general of the many consequences of the impact of Darwinism upon the sciences of man and nature. This was to shift the conception of "scientific thinking" into a temporal perspective; to stress relations and activities as against terms and substances, genesis and development as against intrinsic character, transformation as against continuing form, dynamic pattern as against static organization, processes of conflict and integration as against formal composition out of unchanging elements. In short, the shift was from "structure" to "function" as the principal tool of scientific explanation and interpretation.

These pairs of antitheticals, together with others of similar intent, express contrasts which experience is everlastingly turning up and of which the classic tradition in philosophy has taken characteristic account. Since the life of man is a sequence of events and not an eternal substance; since it is recorded as biography and history and not as principle or law, it constitutes a flux of experiences springing from an unknown source and flowing to an unknown terminus between birth and death. The concern of the classic tradition was to give character, local habitation and name to the source and the terminus. It used the achievements and practises of religion, of art, of the economic establishment and the political institution as extensions of the unknown. By means of data selected ad hoc from these modes of social interaction and external

adjustment it referred the chances and changes of biography and history to necessary law and immutable substance. It demonstrated every change as an expression of changelessness, every activity as a manifestation of substance. Thus it treated of human nature as immortal soul equipped with unchanging faculties; it treated of nature as substance, as eternal idea or form, unmoved and unmoving in itself but the cause of the motion of all moving things, making them one with its oneness, good with its goodness and true and beautiful with its truth and beauty. According to the philosophic tradition such order and direction as may be found in the dark confusion of experience is an expression or projection into unreality of the lucid structure of the world of substance beyond. Outside of that world the daily life is a dim stream flowing; within, it is no stream. Reason, art, society, salvation are each and all projections or exemplifications of that single order amid the chaos of events. Thus all argument is of a foregone conclusion; all invention only discovery; all technique—whether of government, law or business—only the explication of a priori principles; all knowledge only revelation of a preexisting, self-sustaining and self-sufficient hierarchy of substances; all conduct the exercise, discipline and perfection of unchanging faculty. The oak exists preformed in the acorn, the hen in the egg, the man in the sperm. Growth and change are only expansion and emergence of a structure from its limitations, not the occurrence of new events compounding themselves into a new creature.

This view is held no less by the materialisms of the philosophic tradition than by the idealisms. To both, substance or structure is primary and original, activity or function is secondary and derivative. Functions which were so important in social life that they might not be subordinated were hypostatized. Platonism indeed could well be described as a system of hypostatized functions, extended by the logic of illation to all events of experience; so, for that matter, could Marxism in so far as it holds that history is the dialectic movement of matter to a foregone conclusion. Marxism is in fact a sort of inverted Platonism.

Broadly speaking, the Darwinian hypothesis tended to stand all this on its head. It effected a transvaluation of philosophic and methodological values, lowering the mighty from their seat in biology, psychology, logic, philosophy and the more strictly social sciences and exalting those of low degree. Activity or function, which

had been treated as a dependent variable, a faculty of fixed structure or form, to be defined only with reference to such fixity, now began to receive the primacy formerly accorded to its referent. Function tended to be regarded as the original and to be treated as an independent variable, while structure or form was demoted to second place, a derivative and consequence of the play and sequence of functions. The cumulative effect of this change has been to render substance defunct. In psychology the soul has been replaced with the "stream of consciousness," and the latter with the responses of behavior. In logic the "laws of thought" have been replaced with the theory of scientific method—the techniques of trial and error, doubt, hypothesis, investigation, experiment, verification: the "normative" with the instrumental. Data of psychology were interpreted like those of anatomy and physiology as events in the interplay of two dynamic systems, one an organism reacting to the other, an environment of stimuli among which the first grows but which were not made for it. At first the reactions were regarded as functions in a struggle for survival and were interpreted as survival values. Truth was redefined as the survival value of the processes of cognition, goodness as the survival value of other processes of behavior and so on. The meaning of all events in biography or history was set in their consequences to the fortunes of the organism. Later, however, the processes of behavior were taken sheer, as a sequence of functions, without reference to any subsequent function, as a phase of any activity under observation, without regard to its genesis and without imputation of intent.

The philosophical elaboration and defense of this use of "function" as an instrument of interpretation and explanation is called pragmatism. But the mental posture and the methodology here involved have a wide range beyond any particular school of philosophy. They appear in fact to pervade all the sciences and to suffuse and distort the prevailing philosophies. The reason is probably the fact that the whole trend of the social process since Darwin has been in the direction of functionalism and might be described as its verification and validation. The spread of machine industry with its impersonal automatic engines in continuous action; the tremendous acceleration of the tempo of life by the industrial establishment; the adoption of "efficiency," "service," "progress" and the like as measures of value in the community; all tend

to set up "the functional point of view" both as a cause and as an expression of the temper of the times. Hence even its opposites must assume it to maintain relevancy. In assuming it, however, they distort it to congruity with their own patterns and trends.

The distortion is made possible by the fact that function can be conceived in two ways: as a going process, a neutral mechanism, calling for no external justification and generating its rationale as it proceeds; or as a means to an end, the activities of an agent accomplishing a purpose. In the concepts of survival of the fit and survival value the ghost of the agent still lurked. It made the indifferent processes of Darwinism easy to translate into the purposive direction of Lamarckism and other forms of vitalism, and thus facilitated the absorption of the functional point of view into the philosophic tradition. Function and purpose, varied function and invariant purpose, have always been paired together. But the real animus of functionalism lies in the conception of function without purpose. The traditional philosophies stripped this conception of its essential meaning by means of the organismic interpretation of community and individuality. All such interpretations involve the hypostasis of function into substance. For instead of taking activities at their face value, to observe, describe and measure, the organismal interpretation treats them as a sequence of parts energized and interrelated by a preexisting and unchanging whole called in one connection instinct, in another want or wish, in another organism. It conceives this whole substantially, a being somehow different from their parts and their dynamic interrelations. Bergson, Driesch, Marx and the sectaries deriving from them, contrasted and antagonistic as they are, share this mode of functionalism.

This derives perhaps from the fact that human life as it is lived is a compenetration of survivals, and the past from which the future eventuates is so massive and pervading that willy-nilly old orders assimilate the new into their characteristic patterns. Thinking, which is quite largely a suffusion of new situations with past experiences, operates by folkways and mores of its own. In these substance, if only as a ghost or a *Gestalt*, and teleology, if only as an ideal, are continuously operative. Inevitably specific problems and situations are permeated with those categories which automatically embrace in a defining frame the actual dynamics of conflict and integration, compensation and control,

repression and projection, among an individual's drives and functions and a society's institutions, groups, castes or classes.

Programs of reform and of social innovation exalting function take on a definite color in the light of these observations. Thus guild socialism, syndicalism, communism, Fascism put forward radically conflicting philosophies of society. The first interprets the contemporary socio-economic process by means of an idealized mediaeval order; the next in terms of the Bergsonian *élan vital*; the third through the dialectical materialism of Marx; the fourth is a hybrid of syndicalism and the postulates of capitalist economy. They have in common a rejection of many aspects of the cultural aggregate, such as monarchism, democracy, representative government and the like. Such establishments, they declare, are modes of political operation and control either by parties without any other than the political interest and hence are social parasites or by parties whose interests are aborted or masked. The power which is said to elect government is not the power which actually controls it. Waste and hypocrisy automatically supervene; the social organism corrupts. For health the elective and the controlling power should be identical. So syndicalism and guild socialism propose what communism and Fascism endeavor to accomplish as the communist and corporative states. Theoretically and programmatically such states are organic wholes. All their citizens are organized in industrial unions, soviets or corporations. Each division of an industry constitutes a function within the industry and each industry as such constitutes a function of the state as a whole, integrated with its fellow industries in and through the whole and deriving through this integration all the value or significance they possess. Closely related to these corporative and organismal variants of functional political theory is the recent trend toward pluralism. The chief animus behind the disintegration of the monistic conception of the state is the desire to establish a functional connection between the principle of growth in a group or association and its mechanism of control.

In economics functionalism has taken mainly the form of institutionalism as embodied in the point of view of Thorstein Veblen and his followers. The hates and enthusiasms of Veblen often deviate him into teleology, but on the whole he appears as the most uncompromising functionalist among social philosophers of the last generation. Malinowski appears to be aim-

ing at an equally thoroughgoing functionalism in anthropology, insisting that questions of origins, stages and laws of development in culture are inferential and secondary and must wait upon the discernment of functions. Functions are events going on, operations of bodily needs and the instrumental uses of objects which constitute their cultural character. They are contents of direct experience, susceptible to observation and analysis. Seen functionally, religion, the arts and sciences become reduced to specific habits, materials, meanings, activities, within the context of a cultural situation, and the forms and structures of such cultural objects become derivatives, concretions or deposits of the dynamic relations in play. What ceases to function, ceases to be. In the study of law an attempt is being made in various ways, notably by Pound, Llewellyn, Hamilton and Moore, to adapt the content of the legal principle in the particular decision to the observed character of the functioning economic or social situation. Even architecture has caught the contagion and opposes "functional" building to historic styles, ornamentation and the like. Functional architecture is construction whose form arises out of the uses for which it is intended and reenforces and is reenforced by those uses. It is presumably characterized by the economy, simplicity and elegance that go with perfect efficiency, discarding superfluities and every other mode of obscuring or defeating the maximum of use.

FUNDAMENTALISM is the name of an aggressive conservative movement in the Protestant churches of the United States which flourished during the decade after the World War. It manifested itself chiefly in the Baptist, Disciple and Presbyterian churches but received considerable support from other ecclesiastical groups. It was characterized not only by its conservatism with regard to traditional popular Christian beliefs but also by its aggressive efforts to impose its creed upon the churches and upon the public and denominational schools of the country. Its conservative supernaturalism was expressed in the “five points of fundamentalism,” which included the doctrines of the inerrancy of the Bible, the Virgin Birth of Jesus, the supernatural atonement, the physical resurrection of Jesus and the authenticity of the Gospel miracles. The first of these points was interpreted by fundamentalism to apply particularly to the Biblical account of the creation of man in opposition to the theory of evolution, which became the central question of the fundamentalist controversy.

The movement was directed against liberal

elements within the churches and against purely scientific or secular interests in American civilization. In the former sphere it attempted to exclude from the churches and particularly from the control of their educational institutions those who did not share the conservative faith. The effort was not generally successful, but in a number of denominational colleges the teachers were required to subscribe to the fundamentalist creed on pain of dismissal and in other instances new colleges in which the creed was made obligatory were founded. The effort to control the public schools in the interest of the conservative dogma was expressed in the attempt to induce state legislatures to pass laws prohibiting the teaching of evolution. This political phase of the fundamentalist movement was strongest in the southern and border states and made itself felt in the middle west but was weak or absent in the New England, middle Atlantic and far western states with the exception of California, where considerable controversy developed around the textbook question. The legislature of Tennessee enacted a bill in 1925, reaffirmed in 1931, which made it unlawful to teach in any tax supported school any theory “that denies the story of the Divine creation of man as taught in the Bible and to teach instead that man has descended from a lower order of animals.” The constitutionality of the law was tested and upheld in the Scopes trial at Dayton, Tennessee, in 1925 and in a later decision in 1927 by the Supreme Court of the state. This trial formed the dramatic center of the fundamentalist controversy. A similar law was passed in Mississippi in 1926, while textbooks teaching evolution were barred in Oklahoma from 1923 to 1926. The Florida legislature adopted resolutions disapproving the teaching of evolution but failed to enact a law. In many other states, including Louisiana, South Carolina, Texas, Arkansas, Kentucky, Georgia, Alabama, Missouri and West Virginia, attempts to pass restrictive legislation of this sort were unsuccessful, but it became evident through them that the strength of the fundamentalist movement was considerable. Its effect upon the schools was measurable not only in terms of laws passed but also in terms of social pressure, particularly in many isolated communities in these states. In some instances local or state boards of education were prevailed upon to exclude textbooks unsatisfactory to the conservative sentiment or to exert corresponding pressure upon the teachers.

While fundamentalism drew a certain amount of sympathetic support from the conservative religious groups, such as the Roman Catholic and Lutheran churches, and from conservative parties in other churches it often failed to enlist them in its aggressive efforts to influence legislation; and it remained distinguished from them by the manner in which it threw the weight of its interest upon the popular dogmas of Biblical inerrancy and miraculous supernaturalism while conservatism remained primarily interested in the doctrines of human sinfulness and divine atonement. Fundamentalism shared with conservatism distrust of human nature and reacted with it against the romantic and liberal dogma of human goodness and self-sufficiency, but in accordance with its non-theological and popular character it placed its emphasis on myth rather than on doctrine.

In the social sources from which it drew its strength fundamentalism was closely related to the conflict between rural and urban cultures in America. Its popular leader was the agrarian W. J. Bryan; its rise coincided with the depression of agricultural values after the World War; it achieved little strength in the urban and industrial sections of the country but was active in many of the rural states. The opposing religious movement, modernism, was identified on the other hand with bourgeois culture, having its strength in the cities and in the churches supported by the urban middle classes. Furthermore, fundamentalism in its aggressive forms was most prevalent in those isolated communities in which the traditions of pioneer society had been most effectively preserved and which were least subject to the influence of modern science and industrial civilization. Its rejection of a dynamic conception of creative processes was due partly to the inadequate development of educational institutions for both clergy and laity in isolated and poor communities or religious groups, partly to the static character of the culture prevailing in these societies. The contrary movement was associated with an industrialized civilization in which the acceptance of change as a primary law of life was encouraged by the dynamic and changing character of the social process, especially in the economic sphere, as well as by the more effective contact with modern science through its schools. Again, the fundamentalist attitude reflected the distrust of reason and the emphasis upon emotion, the doubt of human ability to solve ultimate problems and the reliance on divine agency which

are characteristic not only of much traditional Christianity but also of those groups which have received the least profit from a rationalized culture and of pioneer or isolated rural societies which remain most conscious of dependence for their livelihood on those processes of nature which are least subject to human control. The rationalism and self-reliance of the opposing groups, on the other hand, had been fostered not only by science and education but also by industrialized culture with its rational and artificial methods of production and its immediate urban environment, all largely subject to human control.

The fundamentalist movement was related in some localities to the Ku Klux Klan and to similar types of intense racialism or sectionalism. With them it shared antagonism to changes in the mores which the war and its consequences, the rise to power of previously submerged immigrant or racial groups and other social processes, brought forth. The political effectiveness of fundamentalism was due in part to this association and to the support which it gave to political leaders, who found in it a powerful symbolism representative of the antagonism of political and economic minorities against the eastern or northern urban industrial majority.

FUNERALS. In the United States ancient funeral customs and traditions have been modified by commercial enterprise: the old wedge shaped coffin has become obsolete; different styles and grades of caskets are available, ranging from a cheap cloth covered pine box to an expensive cast bronze sarcophagus. In Europe, on the other hand, the number of styles of

coffins is relatively small and these still follow conventional lines. Embalming has been developed in the United States to a high degree of effectiveness. It is almost universally used, except among orthodox Jews, and has had a marked effect on funeral customs and incidentally on funeral costs. The preservation of the body makes it possible even in the poorest funerals for the body to lie in state for several days. In most European countries embalming is seldom practised except when the body must be shipped to a distant point.

During the last twenty-five years, while the population has steadily increased, the annual death rate has dropped, with the result that the annual number of deaths, with a few minor fluctuations, has remained practically stationary. Yet during this period the burial industry has had its greatest expansion both in regard to the number of persons and firms engaged therein and the total money volume of business transacted. In 1900 there were 16,200 undertakers in the United States; in 1920 there were 24,469, an increase of 51 percent. The estimated number of deaths in 1900 was 1,352,703; in 1920 it was 1,394,078, an increase of 3 percent. In 1880 the average number of deaths per undertaker was 194; the number steadily declined until in 1920 the average was only 57 deaths for each undertaker. The business is not evenly distributed among undertakers; in New York City 8 percent of the undertakers handle 44 percent of the business. The other 92 percent have each only two funerals a month. The marginal undertaker is therefore an important factor in the problem of high funeral costs. There has been practically no elimination of marginal establishments, and the industry to make profit has persuaded the public to purchase more expensive merchandise and to hold more elaborate funerals. The casket manufacturers have made it possible for the small undertaker to survive by helping him to sell more expensive goods. In 1889 the average wholesale value of burial merchandise was \$10.11 per funeral; in 1927 it was \$55.38.

A survey of all the social and economic factors which determine funeral costs on the basis of 15,100 samples of funeral expenditures among various economic groups and from typical communities revealed that for estates of less than \$1000 in New York City funeral expenses absorbed 52.2 percent of the assets and 62.1 percent in Brooklyn, while in estates valued at over \$100,000 less than 1 percent of the estate was

absorbed. The average funeral bill in all New York estates was \$772; in Chicago it was \$480 and in Pittsburgh \$460. The average funeral charge for 7871 adult industrial policyholders insured by the Metropolitan Life Insurance Company was \$363. The highest average, \$484 for New Jersey, was two and one half times the lowest average, \$194 for North Carolina. Funeral charges were highest in the east and lowest in the south. Ohio, however, with an average cost of \$415, outranked New York, where costs were \$404. Newark with an average funeral cost of \$493, Philadelphia with \$483 and New York City with \$432 far exceeded the costs in southern and mid-western cities. Nashville was lowest in the list of large cities with an average cost of \$233. A study of 3123 claims submitted to the United States Veterans' Bureau for the hundred dollars awarded by the bureau for the burial expenses of veterans showed that in towns under 10,000 in population funeral expenses averaged \$241, in cities of from 10,000 to 250,000 they averaged \$270 and in cities of over 250,000, \$336. This is perhaps what should be expected, for land values, wages, rent and taxes are usually higher in larger cities, increasing operating costs. That funeral expenditures were much higher among the Irish and Italians than among the Jews was shown by a study of 319 dependent widows receiving grants from the New York Board of Child Welfare. Irish widows spent on the average \$452, which absorbed 44 percent of the net assets, and the Italians \$421, representing 50 percent, while funeral expenditures by Jewish widows averaged only \$247, 27 percent of net assets.

Public ownership and operation of the mortuary industry to prevent the exploitation of the poor and middle classes by commercial undertakers and to provide burial for those without funds are found in many European cities. Some cities provide only a partial service and that often in competition with private undertakers, while other cities have a complete monopoly of funeral services. Since 1890 Swiss cantons have established free burial service, supported in part by the municipality or canton and in part by the state, for all persons holding certificates of residence, regardless of citizenship. Services are exceedingly simple and are uniform for all. Interments are made in rows in the municipally owned cemeteries. Individuals may, however, elect more expensive coffins and extra carriage hire, but the municipal

hearse must be used. Various towns and cities in Saxony are operating, with some modifications, on the Swiss principle. From the beginning of the nineteenth century until December, 1904, funerals in France were controlled by the Catholic church, which sublet the business to the highest bidder. In 1904 the control of the disposal of the dead was withdrawn from the church and granted to the municipality and now all French cities have a municipal monopoly. The burial service may be conducted either directly by the municipality or by a concessionaire. Eight classes of funerals are provided, ranging from the very simplest, which is little more than a pauper burial, to a very elaborate and expensive affair. In Frankfort on the Main funeral management has been regulated since 1828. By 1900 abuses had become apparent and in 1907 the city attempted to prohibit private enterprise entirely. When this was declared illegal, the city entered into competition with private undertaking firms, with the result that they have disappeared with one single exception, which is under the control of the municipality. A rigid scale of prices based upon annual income is fixed by the municipal burial office. For adults the prices of the uniform funerals range from \$57.12 for the group whose annual income is 8000 marks (\$1904.76) or over to \$8.57 for those whose income is less than 1200 marks (\$285.71). In Munich there are no commercial undertakers and the city has a monopoly, providing six distinct classes of funerals for adults and four for children with prices ranging from \$15.48 to \$176. The municipalities of Milan and Genoa have monopolies of the undertaking business and furnish various classes of funerals at fixed prices. In 1908 Madrid began a monopoly of the undertaking business through the concessionaire system. A single firm, granted a concession to care for the dead, paid into the municipal treasury a percentage of the price of funerals ranging from 8 to 20 percent. In 1922 this plan was abandoned.

Prior to 1919 the funeral business in Cologne was in the hands of private undertakers, but since then the city administration has entirely assumed this function. There are in Cologne about fifty undertakers, who do not have charge of funerals but merely deliver coffins, decorations and other material. A similar arrangement exists in Copenhagen. Berlin, Dresden and Vienna provide all of the services connected with funerals but do not have a complete monopoly of the business of the city. Only in

Switzerland does the government offer free burial service.

This survey would be incomplete without reference to the provisions made by the working populations to assure themselves funds for decent burial. Burial clubs are the oldest known form of mutual aid association. Today fraternal organizations and friendly societies and even many trade unions grant death benefits to their members and pay them funeral honors. In England and America and to a lesser degree in the countries of northwestern Europe industrial life insurance companies, working largely upon the fear of a pauper's grave, have enrolled large sections of the wage earning population as policyholders. The efficient post office monopoly of Japan is rapidly increasing its industrial insurance business. Allowances for funeral expense are granted by the sickness insurance laws of Norway, Germany and many of the central European countries. The almost universal workmen's compensation laws provide for families faced with death caused by industrial accident. In America group insurance has increased from a total value of a billion and a half dollars in 1921 to more than nine billion dollars in 1927, and is regarded by many as a substitute for some of the forms of social insurance prevalent in Europe.

In the English speaking countries insurance benefits and wages something over the subsistence level have provided burial funds adequate enough to prevent a widespread demand for public funeral services. Commercial undertakers are still in complete control of funeral practices and prices.

FUNK, FRANZ XAVER VON (1840-1907), German Catholic historian. After graduating from the University of Tübingen Funk completed his theological training at the seminary for priests at Rottenburg. A period of study at Paris settled his interest in social and economic

problems. In 1870 he succeeded Hefele as professor of theology in Tübingen and six years later became associate editor of the *Theologische Quartalschrift* published by the university. With both of these institutions he remained connected until his death, the contributions which as early as 1867 he began pouring into the *Quartalschrift* continuing uninterruptedly throughout the entire period. These articles, with numerous others, were later collected as *Kirchengeschichtliche Abhandlungen und Untersuchungen* (3 vols., Paderborn 1897-1907).

Funk's early writings, showing the influence of his study at Paris, revolved primarily about the relation of Catholic ethics to economic institutions. Two significant works belong to this period: *Zins und Wucher* (Tübingen 1868) and *Geschichte des kirchlichen Zinsverbotes* (Tübingen 1876). Starting from the assumption that "every normal institution and category of economic life is in itself either morally indifferent or morally legitimate" (*Zins und Wucher*, p. 266) he considered interest on loans to be legitimate in itself and to be forbidden only when the common norms of law and justice were violated either through deceit or through usury. So long as loans had been made primarily for consumption purposes, interest had been correctly identified with usury. But with the change in economic relations such identification was no longer possible. Accordingly the church's ban on interest signified only a ban on usury. With the same candid and exhaustive scholarship that made these early works acclaimed by economists as well as by theologians Funk applied himself in his later writings to the investigation of the literature, culture, discipline and in particular the constitution of the early church. Besides numerous monographs he contributed to the knowledge of this field two important compilations of documents, *Opera patrum apostolicorum* (2 vols. Tübingen 1878-80, 2nd ed. 1901, vol. ii 3rd ed. 1913; German translation 2 vols. Tübingen 1901, vol. ii 2nd ed. 1924) and *Didascalia et constitutiones apostolorum* (2 vols., Paderborn 1906). Funk's *Lehrbuch der Kirchengeschichte* (Rottenburg 1886, 6th ed. Paderborn 1911; tr. by P. Perciballi, 2 vols., London 1914) has been widely used not only in Germany but throughout western Europe as a convenient and accurate manual.

FUOCO, FRANCESCO (1777-1841), Italian economist and publicist. Fuoco was one of the ablest expositors of the theory of rent in Italy during the first half of the nineteenth century, and his writings cover a wide range of economic theory. He defined political economy as the science which "investigates how industry is created, how the system develops, what direction it takes, what causes favor and disturb it; how, from the nature and development of the system, there results today either convenience and comfort, abundance and prosperity or scarcity and poverty." He recommended a judicious use of the algebraic method as the easiest, shortest, clearest and most exact way of presenting economic problems. He added, however, that calculus does not measure causes but effects, not productive forces but products. To those who blamed Canard for the attempt to use mathematics in scientific research Fuoco replied that the latter erred not in the use but in the abuse of the new method. His essays (*Saggi economici*, 2 vols., Pisa 1825-27) on the theory of rent, the metaphysics of economics, the theory of limits as applied to economic problems and on the origin and nature of public and private wealth exhibit an unusual critical spirit. In discussing static and dynamic industry in *Introduzione . . . dell' economia industriale* (Naples 1829) Fuoco displayed a clear conception of the conditions of equilibrium in industry. In the field of credit theory, which he treats in *Magia del credito svelata* (Naples 1824) published under the name of Giuseppe de Welz, to whom Fuoco, poverty stricken, sold the manuscript, Fuoco supported the theory that credit creates capital. Fuoco deserves a distinct place among Italian economists. If the recognition accorded to him fell short of his intellectual attainment it was due to the lack of clarity in his writings and to the fact that he did not systematize his ideas into a unified treatise.

FUR TRADE AND INDUSTRY. For this article it will be assumed that the Oxford dictionary definition of fur as "the short fine soft hair of certain animals growing thick upon the skin and distinguished from ordinary hair which

is longer and coarser" relates chiefly to the fur of the small non-migratory, non-hibernating carnivorous animals, especially the Mustelidae, and the amphibious animals of the Rodentia, chiefly beaver and muskrat, and not the coarse fur, hair or wool of large animals. The fur trade and industry are concerned with the pelts of animals to be made into clothing because of the warmth and thickness of the fur and not of the suitability of the skin for the production of leather. Warmth and lightness are demanded by wearers of fancy furs, and thickness by manufacturers of hat felt from fur cut from the skin. The thick fur of amphibious animals, especially of the rodents, is best adapted to the production of felt, while that of the smaller carnivorous land and water animals is sufficiently light to be used for clothing. The beaver has consequently been of importance to the felt and hat industry, and the carnivorous animals to the manufacturer of fancy furs.

In general fur is produced as a physiological reaction to seasonal changes and is at its prime during the coldest months of the winter. It is dependent also on such factors as food and shelter and varies in character with changes of climate and the age, health and species of the animal. The vast continental land areas of the north temperate regions, especially the northern regions of North America and Asia, are the important fur producing areas. Within these areas in territory unfavorable to agriculture because of geology or climate are extensive coniferous forests, which are essential to an abundance of Rodentia and, in turn, of the important fur bearing Carnivora.

The production of fine fur in large quantities demands a vast, thinly populated forested area with transportation limited to water in the open season. Production consequently has been largely dependent on peoples who have evolved cultural traits adapted to these areas, i.e. people primarily concerned with hunting. Palaeolithic man was probably dependent on wild animals for food and clothing in contrast to the dependence of neolithic man on domesticated animals and cereals. During the period of abundant forests fur was probably an important item of clothing, as suggested by Tacitus. With the clearing of the land, the increasing scarcity of fur bearing animals, the rise of feudalism and the later growth of towns the fur trade emerged and fur increased in value. The consumption of fur is linked to luxury trades and historically the growth of the fur trade is closely correlated with

the rise of luxury demands, since the large number of pelts of small animals necessary for clothing precludes their use as common wearing apparel. It may be doubted whether Mediterranean civilizations developed an extensive fur trade, but in northern Europe the trade became important with the spread of feudalism.

The rise of guilds concerned with the fur trade reveals the course of its development in western Europe. In Leipsic organization of the industry began in the fourteenth century and the furriers' guild (*Kürschner Innung*) dates from 1423. In England the Skinners' Company dates from 1327 and by 1369 furs were being imported from Flanders and badger skins from Germany and Flanders. The Haberdashers' Company, however, absorbed hatters and furriers in 1501, until the spread of the fashion in felt hats made from fine Spanish wool during Elizabethan times led to the formation of a separate felt makers' company in 1604. Probably because of the pronounced rise in Spanish prices with the inflow of American treasure in the late sixteenth century there was a decline in imports of Spanish wool and a demand for new sources of felt. Before the sixteenth century it is difficult to trace the history of French furriers as such, since for several centuries they tended to be dominated by hat makers, who used furs and felts. In northern Europe trade in furs prior to 1600 was confined chiefly to supplies from the Baltic.

The spread of Italian fashions, especially to France, had probably led to a decline in demand for fancy furs and an increased demand for staple fur for hats. The rise of this demand coincided with French penetration of the Gulf of St. Lawrence in search of areas suitable to the production of dried fish for the growing Spanish market. Contact was made at the mouths of the northerly tributaries of the St. Lawrence with hunting Indians and a supply of beaver fur for the expanding hat industry was tapped. There was an immediate and rapid expansion of the fur trade across the northern half of the North American continent, whose history suggests the trade's general characteristics over a long period and over a wide area. The fur trade was the point of contact between two widely divergent cultures, depended upon the absolute advantages of the different cultures and had important effects on both. The Indians obtained access to European goods, especially iron, which revolutionized their culture to the extent that large numbers of people disappeared. When the bea-

ver, by virtue of the Indians' knowledge of its habits together with the assistance provided by European goods, was rapidly wiped out, the Indians penetrated farther to the interior, opening up new lines of trade with more distant tribes for the first time and utilizing the large eastward flowing waterways of Canada to develop rapid exploitation of furs.

The relatively small bulk and high value of furs meant a light return cargo in exchange for a heavy cargo of cheap and bulky manufactured goods. Penetration to the interior accentuated the effects of this characteristic of the trade as it became necessary to take heavy goods long distances, in many cases upstream. Consequently ocean transportation adapted to the fur trade was opposed to the migration of settlers, and increasing costs of transportation to the interior drained the energies of the colony, accentuated problems of competition and in the main tended toward the growth of monopoly and centralized control. From the beginning of the seventeenth century the tendency toward centralization has been conspicuous.

With the lengthening of transport lines to the interior competition threatened from adjoining drainage basins, first that of the Richelieu River and later that of the Mohawk route to Lake Ontario and Hudson Bay. The centralized organization of the colony dependent on the fur trade faced serious direct losses of trade and military expenditures to check competition. The French fur trade was characterized by a continued drain on the colony and by collapse of political control; eventually the geographic limitations on the trade under the prevailing technique led to the downfall of New France.

The trade also had serious effects on the consuming country, not only involving it in the colony's production difficulties but also in difficulties from the standpoint of consumption. In the latter part of the seventeenth century the rapid decline of the consumption of beaver, largely as a result of fashion changes and the competition of other raw materials, created serious problems for both New and old France in industry, trade and finance.

Improved transport technique and organization together with industrial and marketing efficiency facilitated English trade expansion from Montreal. The tendency toward centralization was shown especially after the outbreak of the American Revolution in 1775 in the formation of the Northwest Company, which included in its trading territory practically all of modern

Canada. The importance of inbound cargo eventually led to the disappearance of the long Montreal route, and following the amalgamation of the Northwest Company with the Hudson's Bay Company in 1821 the Hudson Bay route by York Factory controlled the western trade. Centralized organization was particularly important in negotiations over boundary disputes, and the economic boundaries of the fur trade came to correspond closely to Canada's political boundaries. The significance of the fur trade for Canada was shown in the rapidity with which the country was explored and exploited and in the problems which followed the adaptation of later types of economic development to the political boundaries. The rapidity of its exploitation facilitated the intrenchment of its institutional inheritance and contributed to the problems which arose with its disappearance and the emergence of new types of economic activity. The peculiar characteristics of Canadian development, such as the transcontinental and centralized type of railways, banks and other institutions, and the importance of government ownership are closely related to the early dominance of the fur trade.

Improved transportation, such as river steamboats, railroads and gasoline transport, hastened the breakdown of centralized control by encouraging competition and by exhausting fur supplies. The Hudson's Bay Company has lost control relatively but has gained through the rise in frontier land values, the establishment of retail stores and depots for mining explorations. Improvement in transportation facilitated centralized control within the organization and the share system of the Northwest Company disappeared in favor of the increasing centralization of the Hudson's Bay Company and the intrenchment of the wage system by the end of the nineteenth century.

The fur trade of the United States differed from that of Canada primarily because of its relatively minor importance. Its development was linked more closely with other economic activities and consequently it left no such definite stamp on the political and economic structure. Explorers and traders, first from the St. Lawrence basin and later from New York and St. Louis, penetrated the fur trading areas of the United States. Centralization was worked out by Astor in the American Fur Company and its subsidiaries but never satisfactorily included the whole of the northern United States. The rapidity with which settlement followed the fur trade led inevitably to difficulties between the

government and the Indians which were much more serious than in Canada. In the United States as in Canada the tendency toward centralization led to early concentration of wealth and enabled the fur trading interests to take advantage of other rapid economic developments which followed. Astor in the tea trade and in New York real estate and Lord Strathcona in Canadian railways may be cited as examples.

In Russia the early fur trade centered in the northwest, especially at Novgorod, passing across the Baltic Sea through such organizations as the Hanseatic League, and in the northeast, especially at Nizhni Novgorod, whence merchandise was shipped south, toward the Black and Caspian seas. In the last half of the sixteenth century trade developed across the Ural Mountains and in its tracks came Russian domination of Siberia. Fancy furs, particularly the highly valuable sable, occupied a position similar to that of the beaver in North America. The problem of transportation in Siberia was accentuated by the northward flowing rivers. The supply of furs was less certain than in the case of North America, since the cultural discrepancy between the peoples of Siberia and Russia was less pronounced; consequently furs were obtained by the Cossacks in tribute rather than in trade. Depots were established from Tobolsk eastward to Omsk on the Ob, to Yeniseisk and Irkutsk on the Yenisei, to Yakutsk on the Lena, and to Okhotsk on the Pacific in 1639. About 1740 penetration to Kamchatka and northeastern Siberia led to the discovery of the fur seals and sea otters of Bering Strait and the land furs of Alaska. The difficulties of trade led to a continuation of the tribute policy. The severe competition which followed the decline of furs and the high costs of penetrating Alaska led to centralized control in the Russian American Fur Company especially after 1799 and to central political control. Exhaustion of furs on the southern Pacific seaboard was hastened by the discoveries of Cook in 1778. English and American ships engaged in the trade, especially that of the profitable sea otter, to China. By the end of the eighteenth century virgin fur areas had practically disappeared in North America and Asia.

In the nineteenth century there was a steady decline of wild furs and a rapid development of agriculture, lumber, pulp, paper and mining industries in areas formerly occupied by the fur trade. The industrial revolution hastened the demand for new supplies of raw material and the movement of population to new areas. In

the northern half of the northern hemisphere the legacy of the fur trade was shown in centralized economic and political control and in the sudden changes in development which characterized delay, followed by extraordinarily rapid development dependent on the application of mature technique to virgin natural resources. The highly valued fine furs consequently increased in price and in turn were subjected to more rapid exploitation. The trend in production of fine furs is downward. It may be increased as a result of the work of biologists engaged in the study of periodic fluctuations in animal life; but, on the other hand, the spread of humanitarianism may hasten an increase in production of furs from farms and a decline in production of furs from wild life.

Rapid improvement of transportation and exhaustion of supplies have created serious labor problems. The spread of diseases introduced by the white man and the hardships of their work have threatened the existence of the Eskimos and the Indians who have concentrated their energies on trapping while the increasing effectiveness of trapping methods introduced by the white man and the widening of the latter's range through use of the gasoline engine have made profitable trapping more difficult for the natives. Industrial fluctuations in frontier industries and the reluctance of frontiersmen to enter mechanized industry have acted to maintain a large steady supply of white trapping labor.

The decline of native populations and the increase of white trappers have affected the marketing structure of the industry. With increasing competition monopoly has steadily weakened and large numbers of new centers have challenged the importance of the older centers. As transport has improved, cash payment has tended to displace the credit system and the white trapper has spread the auction market. While marketing and manufacturing technique have tended to broaden out as a result of mechanization, the difficulty of grading furs has restrained the growth of the marketing structure.

The marketing structure of raw furs has been tremendously influenced by the increasing importance of the United States. The sale of furs at the various fairs in Russia and in turn at Leipsic has become less important because of Soviet centralized control and despite strenuous German efforts to regain the pre-war trade. The efforts of the Hudson's Bay Company to maintain control of the London market have met with considerable success by reason of its substantial

control of important Canadian producing areas and its prestige in marketing. On the other hand, the cheaper furs, for which the demand for efficient grading has been less conspicuous, have been sold to an increasing extent in new marketing centers in North America, such as St. Louis, New York, Montreal and Winnipeg, which emerged during the war. Improvements in communication, especially the radio, and in transport have contributed in hastening important changes in marketing structure.

Decline in supply has been accompanied by a rise in demand. The growth of metropolitan centers, especially in the New World, and the rise of a wealthy class seeking luxuries have been responsible for a marked increase in consumption and rise in the prices of furs, especially since 1900. The long run effects of decreased supply and increased demand which become conspicuous after that date have reduced the relative importance of short run fluctuations. Short run fluctuations in demand through changes in fashion or through the general effects of the business cycle after 1900 have been responsible for more rapid and violent changes in fur prices, tendencies which have been most conspicuous with fine furs but have also become important for lower grade furs. The World War shut off the Leipsic market and disrupted the trade; low purchasing power of European countries and temporary prosperity of the United States in the post-war period have tended to accentuate the effects of the preceding period. The rise in prices, especially of fine furs, has contributed to the decline in supply. New sources have been tapped, such as the white fox of the arctic region during the war, the chinchilla and the nutria of South America, the wombat and the kangaroo in Australia. High prices have coincided with increased efficiency of transport; larger numbers of trappers, improved trapping technique and more intensive competition have contributed to decline in supply.

The circle of destruction of product and higher prices followed by increased demand, which characterizes luxury products, has led to conservation measures and attempts to increase the product from other sources of supply. Conservation measures have been difficult to adapt to the trade. The multiplicity of jurisdictions in any one fur trading area make uniformity of legislation and administrative machinery difficult to achieve. The character of the commodity facilitates smuggling and adequate supervision is expensive if not impossible. Taxation designed

to support the enforcement of regulations may by increasing costs accentuate the problems solution of which is sought. Nevertheless, various control devices have been developed. Especially since 1900 the more important fur producing animals have been protected by closed season regulations and prohibitions as to methods of capture, enforcement being supported by license fees paid by trappers and traders, royalties and fines. British Columbia has established definite boundary lines for small areas and licensed trap lines. Especially in Canada and the United States reservations have been established and organizations for forest fire protection and the education of public opinion to the conservation of wild life have been encouraged. The Soviet government now fully controls the production and export of furs in Russia. International agreements have contributed to the control of very valuable fur bearing animals, as in the case of the monopoly of the United States over the fur seals of the Pribilof Islands in Bering Sea, where in 1927 there were 808,870 animals in hand and 30,298 skins were taken.

The raising of animals for the production of furs has been a striking development following the rise of prices. After a long period of experiment problems of technique in breeding and raising animals, in finance and in marketing have been gradually solved; for example, fur farming of silver fox has become an important industry in Prince Edward Island as well as in various provinces of Canada, in the United States and in Europe. Other species have been added and the technique of domestication is being slowly worked out. Cheaper grades of fur, especially muskrat, have been the object of similar interest. Despite fluctuating prices and changing fashion the industry has steadily gained ground.

The most significant contribution to the problem of meeting the increased demand for furs has been the development of improved dyeing and manufacturing processes. Sewing machines became increasingly important after 1880, various inventions after 1900 led to the application of motors and the use of high speed machines, and coal tar dyes were improved and adapted to furs especially after 1888. Now that large quantities of cheap furs (rabbit, opossum, skunk, domestic cat, dog, lamb) can be placed on the market as products similar in appearance to fine furs, new production areas, including South America, Australia and Africa, have become important. As a result of the introduction of the

new methods of preparation the advantages of highly technical skill concentrated first in the guilds and later in special localities tended to disappear. Dressing and dyeing industries, formerly centered in England, Germany and France, began to spread to the United States, which made further gains as a result of the war and the emigration of technical skill from Germany. Thus the value of the output of the fur dressing and dyeing establishments in the United States increased from \$2,875,000 in 1914 to \$34,656,000 in 1929. This development was also encouraged by a tariff on dressed and dyed skins, while the import of raw furs is free of duty. Consequently the import of raw furs increased enormously in the post-war period, while that of dressed and dyed merchandise suffered a comparative decline.

The expansion in American dressing and dyeing was concomitant with the rapid growth of the entire fur industry in the United States. The value of the output of fur manufacturing shops rose from \$43,633,000 in 1914 to \$198,042,000 in 1923 and \$277,058,000 in 1929. The increase was due primarily to post-war prosperity and reflected the general growth of the luxury trades; higher prices, however, were also a factor. This popular demand stimulated large scale production and the handling of cheaper furs, the transformation of which into imitations of more expensive furs was facilitated in recent years by important technical improvements. As a result the misnaming of furs increased tremendously and created a real marketing problem. In 1928 the Federal Trade Commission called a conference of the interested parties to eliminate objectionable practices; and rules were adopted to standardize the naming of furs, which offered partial relief.

The three constituent factors in the fur industry, in addition to the trappers and collectors, are the dyers and dressers, the manufacturers and the wholesale dealers. The dressers and dyers have a considerable investment in their plants; they work on a charge basis and sometimes finance wholesalers and manufacturers. The manufacturers prepare for garments the skins obtained from the wholesale dealers and dispose of their product to garment jobbers and department stores. The workers in fur shops, skilled craftsmen with a good sense of color, cut, match and sew the skins together in sections; individual manufacturing processes are necessary in accordance with the nature of the furs. The wholesale dealer purchases the raw skins

from the country collectors or imports them from abroad, contracts with the dressers and dyers and sells to manufacturers, whom he frequently finances. In addition the large dealer in raw furs may have interests in other branches of the industry; one large raw fur company in New York, which increased its business from \$300,000 in 1901 to \$12,000,000 in 1929, recently acquired the controlling interest in the largest fur coat jobbing concern in the United States. Most of the dealer business is transacted on credit; in 1928 the credit sales of members of the American Fur Merchants' Association were \$138,000,000, the cash sales only \$15,000,000. Cash transactions are the rule at the fur auctions, which handle in addition to some imported furs about one third of the American fur take. All branches of the industry tend to concentrate in the New York area; in 1927, for example, 209 of the country's 2756 establishments were located in New York City.

Changes in the industry have affected the marketing structure of the finished product. The difficulty of standardizing fine furs has been responsible on the one hand for the continued importance of the highly skilled firms and of the exclusive stores, especially in fashion centers, and on the other hand for the importance of a large number of small firms. The enormous increase in the production of low grade furs has made the fur manufacturing industry sensitive to style changes and enhanced its speculative character; it has also emphasized the importance of standard marketing machinery, strengthening the position of such organizations as department stores in the handling of the finished product. The luxury character of the commodity and its speculative character intensify the importance of firms with an established reputation.

The highly speculative character of the American fur industry has been aggravated in recent years by rapid growth, an increase in the number of small competitive concerns and the prevalence of credit transactions. The slump which began in 1926 grew steadily worse, so that the output of fur goods in 1929 was considerably lower than in 1927. Among its basic causes were overbuying of raw materials, overproduction, the maintenance of prices on a high level despite the sharp fluctuations, and the lowered quality of products. The results were most severe among the smaller dressers and dyers, 382 of whom failed in 1928 with losses of \$13,528,000. The industry has been considering plans for control and stabilization. There have also

been attempts to stabilize conditions on an international scale; the Leipsic International Fur Exposition in 1930, at which the United States was well represented, discussed proposals for an international court of arbitration, an international credit bureau and agreements on grading, misnaming and other subjects.

The instability of the industry creates extreme insecurity of employment. Wages are apparently high, but they benefit only a minority of highly skilled and steadily employed workers; the rest earn considerably less primarily because of chronic unemployment. Since the 1926 slump approximately one half of the workers employed in the fur manufacturing shops in New York City have been almost continuously unemployed. These conditions produced unrest among the members of the International Fur Workers' Union and the left wing secured control of the union in 1926. A strike in 1927 was unsuccessful, and the continuous internal dissensions led to the reorganization of the union by the combined efforts of the old officials, the employers and the American Federation of Labor; its membership, however, declined to less than 3000 in 1929 as compared with 11,400 in 1925. The communist group organized an independent union with a considerable membership; it is a part of the Needle Trades' Industrial Union.

The fur trade is an index of the decreasing disparity between the cultures of the northern hemisphere resulting from the spread of industrialism. Machine industry, seeking forests and mines, has taken possession of territory formerly controlled by the fur trade and has contributed to the decline of wild life and of fur trapping by the aborigines. The effects of machine industry on demand have been scarcely less important. The demand of metropolitan centers in the north temperate areas of Europe and Asia for furs was dependent on the existence of distinct social classes. Furs were used as an item of dress designed to emphasize class distinction because they were obtained from distant areas and were correspondingly expensive. Their early significance with relation to men's clothing declined with the growing importance of women's costumes as a more subtle device for enhancing the prestige of wealth. The increasing use of silk for that purpose was accompanied by the employment of fancy furs, especially in the manufacture of coats as a complement to lighter clothing. Rapid exploitation of the resources of the New World created new demands for furs as a most satisfactory medium of emphasizing

the status of the *nouveaux riches* at the same time that it undermined the supply of fine furs for the future. The aristocracy now found that furs were no longer of distinctive importance to the maintenance of its position and its demand for fine furs declined accordingly. The increasing demand of larger numbers of women for furs has been met only by recourse to the increasing efficiency of machine industry. The rise of democracy has become the dominating factor in the world's fur trade.

FURNITURE

GENERAL AND HISTORICAL. The history of the invention and development of furniture must study man's pursuit of comfort from the rigors of migratory life to the sedentary domesticity of contemporary centralized living. Fulfilling a less crucial function than shelter or clothing, the use of furniture follows upon the accumulation of an economic surplus and the establishment of the home, with the consequent opportunities for leisure and for the cultivation of comfort, prestige and aesthetic pleasure. The nomadic character of much of primitive society, with the frequent migration of families to better sources of food supply, forbids the transportation and hence the use of furniture; a bed of skins on the hard ground fulfils the needs of tough active bodies. The emphasis in primitive society, however, is on community life rather than on that of the individual dwelling. Furniture becomes a concern only with the development of a settled and relatively peaceful life either in cities or in agricultural communities. Then arises the sacred tradition of hearth and home, and the home acquires its nucleus of bed, table and chair.

Although the nature of the Greek climate is such that no actual examples of Greek furniture are extant, some knowledge of it is possible, thanks to the countless illustrations of the daily life of the Greeks which still exist in vase painting and sculpture. In the earliest Greek period there appears the *thrōnos*, the high seat of god or dignitary when the Olympians consorted with mortals. In council or at the games headmen sat ceremonially on thrones, while subordinates occupied benches or stools. The figures are shown feasting, reclining on their beds or couches, eating from small three-legged tables which could be removed or slipped beneath the couch. The wooden couches either have turned legs identical in pattern with earlier Egyptian examples or borrow somewhat clumsily from architectural design. Except for the beautiful *klismos*, or reclining chair, used chiefly by women, the Greeks owe all their furniture forms to the Egyptians. They invested these borrowed patterns, however, with that same regard, fresh and new to the world, for plastic and not merely symbolic form which made Greek architecture the sublime achievement of antique art. Although early furniture is largely ceremonial, the functional element played an important part in Greek furniture. The Greek, still the soldier, had about him only what he could use, utilitarian forms exquisitely molded and decorated. Luxury was

apparent in the soft mattresses, the beautiful dressings of the beds, the dyed and embroidered silk and woolen covers.

In the commercial civilization of the Hellenistic period the elements of luxury were intensified. In the hands of the provincial Romans who had become world conquerors Greek furniture underwent a considerable change. The Roman genius for power and organization preyed upon Greek perfection with clumsy fingers, attempting to possess an art which in becoming the vehicle of power, wealth and ostentation lost its magic. The Romans used the same forms as the Greeks, the throne, chair, couch, stool and chest, and in addition the three-legged pedestal table and an ancestor of the parlor sofa. But they made heavy the clear grace of Greek form and added bronze, gold, ivory, rare veneers of wood and shell, precious marbles and gems. Such furniture was needed for a landowning and commercial aristocracy that lived in palatial houses thronged with slaves. It transcended its functional uses and became luxurious and even purely decorative.

In Byzantium the survival of Hellenistic culture continued for centuries to inspire furniture of elaborate and debased, strongly orientalized classical forms in an almost static tradition down to the fall of Constantinople in the fifteenth century. In western Europe the growth of new cities after the barbarian invasions called forth furniture which was but the further perpetuation of late Roman forms in a series of ever uglier repetitions. Among Teutonic peoples the making of furniture was practised as a craft, with almost no variation from the late Roman type, down to the end of the fourteenth century. Throughout the great ages of Gothic architecture this furniture shows, save in the churches and monasteries, no direct influence of Gothic design. As a craft it retained a fair degree of utilitarian dignity. In Scandinavia a wild and primitive people made furniture of solid wood carved with intricate interlacy, full of dragons, scenes of fighting, piracy and treasure hunting. In Paris, the world renowned center of the furniture industry throughout the Middle Ages, artisans made rich seats, couches, tables, chests, dressers and cupboards for king and baron. Great skill if little taste was shown in handling solid gold, ivory and precious stones at fabulous costs. Furniture in the Middle Ages as in Rome followed consuming power and was chiefly reserved for those at the apex of the social pyramid. Like the landless proletariat who had poured

into Rome the mediaeval serf had little if any furniture—a bench, a table, possibly a bed.

The brilliant consumers' civilization of the fifteenth to seventeenth centuries broadened the market for costly furniture. The commercial revolution brought with it the rise of the rich Flemish and Burgundian cities and the dawning Renaissance culture of the Italian city-states. A rich bourgeoisie became part of the class structure, and in the homes of wealthy merchants furniture of a new elegance superseded the heavy clumsiness of the Middle Ages. The pomp of a reestablished court life demanded the decorative furniture of luxurious living. A fresh impetus was given to furniture design. A new structural principle, first seen in van Eyck's paintings of Ghent, liberated design from the confines of solid wood to a new structural technique of holding thin panels between rails and stiles—thus was the Gothic structural principle at length translated into wood. From this innovation grew larger and more elaborate forms of chest and dresser, especially since the division of the design into horizontal and vertical members was perfectly suited to the pilasters, cornices and panels of the renaissance classical manner. Italy throughout the sixteenth and seventeenth centuries produced pieces of unmatched craftsmanship and imagination. The fire of her decorative artists, now at the peak of their glory as pope and merchant prince demanded more and newer beauty, produced chests, beds and cabinets of great fineness.

Architecture and furniture now came to parallel each other in development and to play related roles. With the rise of the French monarchy the baroque style is seen in constant struggle with the purer classical manner of Vignola. Already apparent is the gradual encroachment of dogmatic rules of design, which reached its climax in the triumph of empirical classicism in the French Revolution. Throughout this era the ever increasing mastery of furniture technique, the richness and luxury of the pieces with their exquisite carving, rare veneers, tortoise shell, gilt, inlay and marbles reflect the gratified tastes of the aristocracy.

The dominance of classicism in eighteenth century art had its effect on furniture forms. But the revival of the concept of classical democracy in the French Revolution, the introduction of the machine and the spread of an industrialized and relatively democratic culture in the nineteenth century had more far reaching effects. On the one hand, the decline of the aris-

tocracy and the broadening of the middle class with its rising standard of living increased the demand for furniture. A society in which the old class structure had disintegrated and in which pecuniary values were dominant had to resort to what Veblen calls "conspicuous consumption" to maintain the boundaries between the new classes. The home became a social ideal—the object of sentiment and the criterion of prestige—and the demand for furniture, once linked with court and mansion, was now linked with the middle class home. The era of romanticism led ultimately in furniture to the practise of eclecticism, or the choosing of period styles for reproduction in furniture design. The fantastically romantic forms of the Victorian era correspond to a vogue for "life as it is not," the escape of a people to ideas more felicitous than the unlovely reality of the dawning machine age.

The coming of the machine meant more than the displacement of the skilled cabinetmakers, local craftsmen and home construction of furniture. It meant also quantity output and stimulated selling. The furniture industry was forced to exploit every weakness of humanity under the necessity to sell. Period styles furnished the easiest and surest approach to popular taste and could with the aid of photography be ever more readily copied. Furniture was now made in "suites" for the purpose of selling five or six rather than one or two pieces at a time. The process of democratization and high pressure selling has left scarcely a home, even among the poor, uncluttered by a miscellaneous array of furniture. But the imitation of handcraft by machine technique has proved wasteful and aesthetically barren. Craftsmen have practically disappeared.

In an effort to remedy this situation, the result of romanticism plus commercial exploitation, the so-called modern movement is attempting to rehabilitate creative design in furniture. The modern designer is taking stock of modern living conditions, modern architectural innovations and modern needs and by so doing is trying to reintroduce the method of functionalism. He is compelled to take account of the heightened mobility of life and the urban congestion which makes every inch of space valuable. He is also considering the problem of the difference between hand and machine technique and the profusion of new structural materials and methods. Metal furniture forecasts the application of steel engineering to furniture.

EDWIN AVERY PARK

FURNITURE INDUSTRY. Until recently furniture was produced mainly for the requirements of an aristocracy of wealth; other people had to make their own crude furniture or live without any. During the seventeenth and eighteenth centuries in most European countries the output of furniture increased considerably—ornate and luxurious furniture for the aristocracy, substantial furniture for the rising middle class; but the output was still for a very limited class market. Even throughout a large part of the nineteenth century the common man still depended for what little furniture he had on the ordinary house carpenter or on his own manual dexterity.

The producer of fine furniture, the master cabinetmaker, usually worked in a small shop with a bench, a number of hand tools, his apprentice and perhaps a few journeymen. Even before the introduction of machinery, however, many large producers of furniture in Europe operated on a factory basis and developed considerable specialization. In the United States in 1816 there were some cabinet shops with a yearly output of \$100,000 and many shops which specialized in the production of chairs. But small cabinet shops and custom made furniture were typical.

During the first two thirds of the nineteenth century furniture making was slowly transformed from a handicraft into an industry under the influence of widening markets and technological progress. As the basic woodworking machines, such as power saws and wood turning and planing machines, were developed they were gradually introduced into the cabinet shops. The machines generally did not cause specialization at first and were regarded merely as additional tools. As they became more complex, however, a specialized group of highly skilled machine craftsmen appeared, and in the larger establishments there developed a subdivision of labor even among the users of hand tools.

The industrialization of furniture making went on most rapidly and reached its greatest development in the United States. By 1860, although the industry still centered in New England and middle Atlantic seaboard towns, where it was largely carried on in small establishments for local trade, it had started to move to the new centers of population in the west, where many factories were equipped with machinery from the start. One factory in Cincinnati, for example, had over 500 employees and eighty power driven machines. It was not until the seventies, however, that with the further improvement of ma-

chinery and reduction of costs, the substitution of quantity production for custom made goods, the rapid growth of transportation facilities and the widening of markets, the increased purchasing power of a rising middle class and the greater availability of liquid capital, the factory began to dominate the industry and pushed the old cabinetmaker farther and farther into the background.

Under the influence of industrialization, quantity production and widening markets the output of the furniture industry increased rapidly. It rose in the United States from \$17,663,000 in 1849 to \$77,846,000 in 1869 and \$125,316,000 in 1899. Output in 1914 was \$265,706,000, an increase even more moderate if the rise in prices is considered. In this the furniture industry reflected the general slowing down of economic expansion during the period. Another great increase occurred from 1919 to 1929, when output rose from \$579,906,000 to \$940,918,000, an increase so much the larger because of the substantial decline in prices. This growth reflected the increase in consumer purchasing power and the increased demand for store and office equipment.

While the industry grew tremendously, the growth of concentration was not correspondingly great. The number of furniture making establishments declined considerably from 1869 to 1899, but they have since increased twofold—from 1814 in 1899 to 3763 in 1929. This is to be explained largely by the fact that mechanization was not so great as in other industries. Although the total horse power used by the industry almost quadrupled between 1899 and 1927, horse power per wage earner in the furniture industry increased only 79 percent as compared with an increase of 117 percent for all manufacturing industries in the United States. Quantity production, considered in terms of thousands in automobile plants, remains in terms of hundreds in even the largest furniture factories. The whole productive process has been greatly accelerated, but some case goods still require from 30 to 120 days to build. While the industry has grown enormously, a great many small furniture establishments have persisted and in several centers they still dominate the industry. These small shops generally make limited quantities of furniture to order and use only a few simple machines for work preliminary to the more difficult tasks of cabinetmaking.

The leading type of furniture manufactured in the United States has been wooden household

furniture, some of which is upholstered. While this class has accounted for most of the industry's growth, in recent years production of furniture for offices and stores and of metal furniture especially for offices and hospitals has become increasingly important.

VALUE OF FURNITURE OUTPUT IN THE UNITED STATES,
1929
(In \$1000)

CLASS OF FURNITURE	TOTAL	WOOD	METAL	FIBER, RATTAN, REED AND WILLOW
Household	659,023	611,681	30,443	16,899
Office and store	193,359	135,849	57,510	•
Public buildings	41,044	28,691	12,353	•
Professional	14,283	6,454	7,829	•
Lockers	5,233	8	5,225	—
Total	912,942	781,195	113,360	18,387

* Included in figure for wood to avoid disclosing output of individual establishments.

Source: Preliminary reports of United States Census of Manufactures, 1929.

An outstanding characteristic of the industry has been its concentration in a few states. New York was the leading producer from 1859 to 1929, but its lead steadily diminished. With the growth of new population centers and the opening of new timber resources in the middle west, Illinois, Michigan and Indiana became of major importance in the eighties, and at this time Grand Rapids became an outstanding center. During the nineties North Carolina turned to furniture manufacture as an early step in its industrialization and in 1929 it ranked fifth. In 1889 the five leading furniture states (New York, Illinois, Massachusetts, Michigan and Ohio) produced 63 percent of the total output and in 1929 the share of the five leading states (New York, Illinois, Indiana, Michigan and North Carolina) amounted to 57 percent. Certain states produce a very large proportion of certain classes of furniture. Thus in 1929 Indiana was the largest producer of wooden kitchen furniture, New York and Illinois of metal household furniture. The industry has also for many years formed important centers in certain cities, although the aggregate importance of these centers to the industry has diminished. Thus the value of the product of the seven largest furniture producing cities (among them New York, Chicago, Grand Rapids and Philadelphia) was 53 percent of the total in 1889 and only 32 percent in 1925.

Furniture manufacture is still a comparatively small scale industry; but, while there were 3763 establishments in 1929, the concentration which prevails is considerable, although not so large as in most other industries. There have been several important mergers since the World War, and in 1925 one seventh of furniture making establishments produced two thirds of the total output. But in no instance did a single firm control any major branch of the industry. In 1923, however, the Federal Trade Commission revealed that certain practises of four leading furniture manufacturers' associations, whose members produced about 30 percent of the country's household furniture, tended to fix prices. Among other things these associations hired one expert who without making any real cost studies published theoretical minimum "selling values" of representative articles of furniture which practically determined prices. In 1920 these manufacturers made an average net profit of 28 percent on their investment. During the eight years following the investigation severe competition among the majority of manufactures revived.

The growth of large furniture factories and the widening of market areas have been accompanied by the development of a number of marketing devices which have largely displaced the old relationship between cabinetmaker and consumer. Because most furniture is bulky, unstandardized and difficult to evaluate without examining, the system of holding markets for short periods of time two or four times a year at leading furniture centers has grown in popularity since the first market was held in Boston in 1874. With the growth of the furniture industry in the southern states the Southern Furniture Exposition was organized at High Point, North Carolina, in 1913. Markets are also held by Pacific coast manufacturers, who largely supply local needs as eastern competition is made difficult by high freight rates. But the most important markets are held at Chicago and Grand Rapids. The one held in Chicago, which is by far the largest in the country, attracts hundreds of manufacturers, practically all of whom bring out at least one new style of furniture at each market. In 1928 manufacturers accounting for over 90 percent of the country's furniture production were represented at the Chicago market, where they did almost a quarter of their total business for the year. Furniture buyers either place orders with manufacturers or examine the exhibits with the idea of placing orders later in the season. This latter practise has increased with

the growth of hand to mouth buying. Since 1920 groups of buying syndicates have frequently been formed, generally by small retailers, to secure the price concessions that manufacturers grant for large purchases and to compete successfully with larger retail units. Most furniture, however, is sold to the retailer on the basis of photographs and descriptions by the traveling commission broker, who represents a number of different manufacturers.

More furniture is sold by independent furniture and house furnishing stores than by any other type of retailer, but the relative importance of their sales is declining. During the decade following the World War department stores and chain stores in the United States greatly increased in importance as furniture outlets; in 1926 chain stores made almost one third of the furniture sales in eleven cities. Mail order houses are important outlets for the rural sections. There is an overabundance of retail furniture stores: one existed for every 2665 people in 1925; in eleven cities 11 percent of the independent stores accounted for 69 percent of the total sales. Competition is severe and failures numerous. Except during the regular February and August sales most retailers have a particularly high mark up, 100 percent being quite usual. This is partly due to high sales costs, the unusually high expense required for shipping, repairing and refinishing work and the ignorance of most consumers. The majority of consumers must depend on the retailers' statement to know what they are purchasing. Even where misrepresentation is not intended—and it is more general and flagrant in this industry than in most—a large proportion of the salesmen know very little about what they are selling, and there is a tremendous amount of ambiguity in ordinary furniture terminology. The consumer, moreover, is forced to pay the price of the wide choice of furniture styles. Several hundred competing manufacturers bring out at least one new style two or four times a year, which perhaps results in an excessive variety, as most people make large purchases of furniture only once or twice in a lifetime.

In 1929 the American furniture industry employed 192,057 wage earners. Most of them were semiskilled and unskilled workers, because of departmentalization and division of labor within departments, automatic machinery and, especially since the World War, the introduction of straight line production methods. Even the work of the upholsterer, which for years had required

a considerable amount of skill, is being subdivided so that it can be performed by semi-skilled workers. Nevertheless, a number of tasks even in the highly mechanized plants require a great deal of skill, as, for instance, the construction of samples, some finishing jobs and setting and operating certain machines. Wages vary greatly and not always in relation to skill. In 1929, for example, the average actual earnings per week of hand carvers were \$42.66; male upholsterers \$33.61; female upholsterers \$16.93; male assemblers and cabinetmakers \$28.44; male helpers \$15.13; and female helpers \$10.37. The average for all furniture workers in the United States was \$25.12 for males and \$16.03 for females; and among the leading furniture states it ranged from \$30.21 for males and \$21.17 for females in Illinois to \$17.61 for males and \$10.00 for females in North Carolina. Average yearly earnings in 1929 amounted to \$1235 compared with an average of \$1306 for manufacturing industries as a whole. In the same year the average number of hours actually worked per week by all furniture workers was fifty.

Unionism in the furniture industry is insignificant. The first important trade union of furniture workers in America, the Furniture Workers' National Union, founded in 1873, was composed primarily of German cabinetmakers. In 1895 it merged with the Machine Wood Workers' organization and became the Amalgamated Wood Workers' International Union. In 1912 the Amalgamated merged with the Brotherhood of Carpenters and Joiners, which since then has had jurisdiction over the majority of furniture workers but, with the exception of a small number of highly skilled men, has had very few members in the industry. By 1931 it had practically given up the idea of organizing furniture workers. Five other craft unions with considerable jurisdiction in the industry have practically no members in this field. The Upholsterers', Carpet and Linoleum Mechanics' International Union, however, for many years has had a number of members scattered through small shops.

Mechanization and large scale production started much later and have not gone nearly so far in Europe as in America. The greater part of furniture is produced in small shops by manufacturers who are frequently also salesmen and artisans, by skilled workers generally trained in the apprentice and master tradition or by craftsmen working in their own homes. There is a large output of fine furniture, particularly in Paris, Vienna and London, and a great number

of small shops specializing in the imitation of period furniture. Modern factories exist, however, in all the important furniture producing countries, and in certain regions the smaller establishments and especially the home workers are finding it difficult to compete with the factory. Industrialization is greatest in Germany, where many furniture factories are highly mechanized and specialized and manufacturers are organized in closely knit trade associations. The production of office and metal furniture is increasing in France, England and Germany. Nevertheless, the custom cabinet shop holds its position in Europe because of the large proportion of individualistic high grade furniture demanded by the wealthy and the relatively small purchasing power of the European masses. This is strikingly apparent in France, the greatest European furniture producing country. Furniture making in Asia is still at the handicraft stage, producing massive, richly carved and inlaid furniture for wealthy natives and foreigners; there are, however, a few modern factories in Japan and India.

In Great Britain between 1907 and 1924 the selling value of the products of the furniture, cabinetmaking and upholstering trades increased from £10,969,000 to £28,518,000 and employees increased from 74,119 to 82,841. In 1924 about a fifth were females; 16 percent of the males and 37 percent of the females were under eighteen years old. About half of the boys and many of the girls were apprentices or learners. Weekly wages ranged from seventy to eighty-six shillings in London and from sixty to eighty-two shillings in the provinces. In 1927 the industry was quite well organized and the normal work week was from forty-four to forty-seven hours. Approximately eight trade unions had jurisdiction over the industry; of these the National Amalgamated Furnishing Trades Association and the Amalgamated Union of Upholsterers were the most important. Since 1893 the Deutscher Holzarbeiter Verband has done a great deal to improve the conditions of German furniture workers.

Foreign trade on the whole plays a very minor part in the furniture industry with the exception of expensive and high quality furniture, as in the case of French exports, and metal office furniture in the case of the United States. In the latter country imports and exports comprised barely 1 percent of its total production of wooden furniture in 1927; total exports amounted to \$3,183,000 and imports to \$4,631,000. There is,

however, a considerably larger interchange of furniture within Europe. In 1927 European countries imported, mainly from each other, \$32,674,000 worth of furniture and exported \$17,657,000 worth; two thirds of the exports were by France, the United Kingdom, Germany, Belgium and Czechoslovakia. The small importance of foreign trade is largely due to the bulk of furniture, differences in construction needed for different climatic conditions, the popularity of national styles, particularly among the wealthy, and the comparatively small purchasing power of lower middle and working classes in countries other than the United States.

FUSTEL DE COULANGES, NUMA-DENYS (1830-89), French historian. Fustel de Coulanges, who was successively professor at the University of Strasbourg, the École Normale, the Sorbonne and finally director of the École Normale, made his reputation through his famous *La cité antique*, which was a pioneer comparative study of Roman and Hellenic societies. Without giving up his studies of antiquity, as diverse memoirs testify, he then undertook his *Histoire des institutions politiques de l'ancienne France*, which he completed only as far as the Carolingian period. His work betrays both the unconscious influence of romanticism, which had introduced into the interpretation of history the notion of the spontaneous, and a very decided reaction against romantic thought in some of its significant features. He hated subjectivism in historical interpretation, practised Cartesian doubt regarding all testimony and based all his conclusions on original texts. Of archaeology he had little knowledge. It has been possible to reproach him for not weighing the authenticity of his documents with sufficient care; but once he admitted a text as genuine he insisted on determining its exact meaning, and his analyses of vocabularies remain models. He rejected the abuse of the racial interpretation of history dear to romanticism and was dominated by the idea of evolution. He attempted to prove that the Teutonic invasions of the fourth and fifth centuries were gradual, not violent and destructive, and to refute the idea that the Middle Ages were a Teutonic creation. The elements of the past found in the French Middle Ages were in his opinion chiefly of Roman origin. The ignorance of the ancient German societies which he displays was due to insufficient means of information, not to nationalistic bias. In *La cité antique* his main emphasis is laid on religious phe-

nomena, which he believed gave rise to law; in his later works a larger place is given to material interests.

Fustel's work was very much discussed during his lifetime, and although many of his theses are now contested it still has profound influence upon historians and upon French sociologists. The political conclusions that have been drawn from his writings by members of the Action Française cannot be attributed to him. His influence in England is revealed in the writings of Seebohm and Ashley; it was much more tardy in Germany.

GABELLE. See SALT.

GAGER, HEINRICH VON (1799-1880), German statesman. Gager was the son of an imperial judge and diplomat. After serving against Napoleon he studied at Heidelberg and Jena. He kept himself free of all radical tendencies and absorbed the Burschenschaft's political ideal of German unity and freedom. In 1821 he entered the Hessian administrative service and in 1832 was elected to the Hessian second chamber. He soon became leader of the opposition and resigned his government post, fighting for moderate constitutional principles until he failed of reelection in 1836 and retired to a country estate. He continued his liberal activities and when he reentered the chamber in 1846 became at once leader of the opposition. In consequence of the revolution of March, 1848, he was made prime minister and minister of foreign and home affairs. He sought to solve the question of German unity at once by sending a common embassy of all south German governments to offer the leadership of Germany to the king of Prussia, in the conviction, partly a result of the influence of his

brother Friedrich, that this state alone was in a position to unite Germany. The attempt failed, largely because of the Berlin March revolution, and Gagern sought the solution by a popular movement. He was among the foremost in efforts to hinder the radical extension of the revolution, to preserve the monarchical form of government and to assure Prussian leadership in Germany. Changes in his attitude in 1848 were but tactical means to the same end. He wished not to separate Austria entirely from Germany but to join it in a confederacy with a federation of the other German states. He became president of the national assembly in Frankfort and later of the imperial ministry, where his influence was decisive in uniting a majority upon the program of a federal state under Prussian leadership. After the work of the Frankfort assembly was destroyed by the king of Prussia, Gagern attempted to attain his objectives by supporting Prussian diplomatic ambitions; hence he took part in the unsuccessful assembly of 1850 at Erfurt. Concluding that Prussia preferred its own national egoism to German unity and that its government throughout was disinclined to fulfil the primary condition he had always attached to leadership—real liberal constitutionalism in home affairs—he came gradually to the opinion that Austria might better be able to solve the problem of German unity. After 1859 he became more and more hostile to Prussia and in 1864 he went to Vienna as ambassador, retaining this post until 1872, when he retired to private life.

GAIUS (second century A.D.), Roman jurist. Only his praenomen "Gaius" is known, while many of the facts of his life and career, to be gathered almost entirely from evidence found in his writings, are much disputed by scholars. Born not later than the time of Hadrian, he was active as teacher and writer in the following reigns; it is certain that he was at work as late as the year 178. His most important contribution to legal literature and the only one that has survived independently of Justinian's Digest was his treatise entitled *Institutionum commentarii quattuor*,

a work closely related in respect both of general plan and of subject matter to his *Res cotidianae*. In each of those works Gaius presented a survey of the entire Roman private law including the *jus honorarium* as well as the *jus civile*, and in each of them the treatment was primarily dogmatic. Begun at the very close of the reign of Antoninus Pius (died 161) and completed in the early part of the reign of Marcus Aurelius, the Gaian institutional treatise is the one classical work on Roman law that has been preserved almost entire.

The rise of Gaius to a position of eminence is attested by the famous Law of Citations, or *lex de responsis prudentum* (C. Th. 1.4.3.), of Theodosius II and Valentinian III (426). By this law, which is the earliest certain reference to Gaius, imperial approval was given to all the writings of Papinian, Paul, Gaius, Ulpian and Modestinus; to Gaius the same authority as that enjoyed by the other four jurists was expressly conceded, while the citation of all his works by judges was sanctioned. At length the high authority of Gaius was recognized by Justinian in his work of codification. Out of a total of 9142 extracts from the jurists embodied in the Digest by Tribonian and Justinian's other commissioners 535 are from the writings of Gaius. The chief influence, however, exerted by Gaius on the Justinianian codification and hence on the Roman law of later times was through his Institutes. The commissioners drew by far the greater part of the substance of Justinian's Institutes from the Institutes and *Res cotidianae* of Gaius; and they also modeled the plan of Justinian's Institutes upon the one which Gaius had followed in his own.

Apart from knowledge of the Institutes gained from the *Collatio legum mosaicarum et romanorum* (c. 390), the *Breviarium alaricianum* (506), non-juristic writers of the late empire and the Justinianian codification, this now celebrated work by Gaius had been lost to modern scholars until in 1816 Niebuhr discovered in the chapter library at Verona a manuscript in which works of St. Jerome had been written over the text of Gaius.

Niebuhr's finding of the last Gaius, communicated at once to Savigny, intensified an already awakened interest in Roman legal history; it coincided indeed with the rise of the historical school. The scholarly study of Gaius during the last century has in fact illumined not only the law of the second century but also, since Gaius in contrast with Justinian introduced much historical matter, the law of still earlier times. Gaius

has likewise exercised a marked influence on legal education during the last century.

For originality and creative genius Gaius cannot be ranked with the greatest of the classical jurists, such as Julian and Papinian; nor perhaps can he be given a place with Ulpian and certain other celebrated legal writers of the classical age, such as Paul. As Krüger has pointed out, Gaius appears to have taken Pomponius as his model; and his close relationship to Pomponius is shown not only by his taking the whole field of the private law, in contrast with the public law, as his province, but also by the treatment of his materials. In the writings of Gaius not less than in those of Pomponius casuistry, or the scientific handling of cases, is combined with dogmatic elaboration; and the exposition of both jurists, composed in clear and simple style, is marked by ease and breadth. While modern critics rightly point out the defects in the work of Gaius, such as his lack of thorough preparation, his errors in legal history and his want of courage in the face of controversial questions, there is, however, general agreement among scholars in according to him a high place among the world's great jurists.

GAJ, LJUDEVIT (1809-72), Croatian statesman and writer. In his youth under the influence of the German culture which prevailed in Croatia during the first half of the nineteenth century Gaj wrote in German. During his studies at the universities of Graz and Pest he was influenced by the ideas of Slavic intellectuals who were striving to cultivate their native tongues,

develop their national cultures and awaken the Slavic consciousness. Their influence, especially that of Jan Kolár, the standard bearer of the romantic historical movement for pan-Slav renaissance, determined all of Gaj's subsequent activities. His pamphlet on the principles of a new orthography of the Croatian language, which appeared in 1830 in both German and Croatian, became vastly important not merely for the creation of a modern uniform orthography and literary medium for the Croats and Serbs but also for the development of cultural and national ideologies, because in it the principle of the literary and cultural unity of the southern Slavs was asserted.

After his return to his native country Gaj by his active national agitation made Zagreb, the old center of Croatian culture, the focus of a new nationalistic, so-called Illyrian movement. A gifted popular leader filled with a prophetic, messianic faith in his mission, Gaj awakened understanding and fanned enthusiasm for national ideals and aspirations and for the southern Slav and pan-Slav movements among the youth, the intellectuals, the bourgeoisie and the Catholic clergy. In 1835 he founded the *Hrvatsko-slavonsko-dalmatinske novine*, the first Croatian newspaper, whose aim was to awaken the Croatian people, defend their interests and formulate their national aspirations. It became the organ of the Illyrian movement, which not only spread to all the Croatian provinces but also affected the other Yugoslav peoples. This movement represented the first attempt to organize all national activities in the fields of politics, literature and general culture. The political aim of Illyrianism was national self-defense against the imperialistic expansion of the Magyars. The literary and cultural program of the movement included the creation of a cultural union of all southern Slavs.

In 1840 Gaj traveled by way of Vienna and Dresden to St. Petersburg in order to win the interest and aid of foreign, especially Russian, official circles for his aims and activities. During the Revolution of 1848 he again became a leading figure especially because of the desire of the nations which formed part of the Austrian monarchy to reorganize the absolutist state on a democratic and federal basis. He conducted important political and diplomatic negotiations on behalf of the Croats, proposed the nomination of General Jelačić as ban of Croatia, and in Vienna at the head of a Croatian deputation presented to the emperor a program which called

for the union of all Croatian lands, the establishment of an independent Croatian assembly and the abolition of feudal privileges. He was careful to prevent the movement for the national liberation of the Croats from directing itself against the dynasty and the state and sought political backing at the courts of Vienna, St. Petersburg and the Serbian ruler. Hence in Croatia opposing tendencies and new movements soon prevailed against him, especially since after the restoration of the absolutist government he placed himself and his services as editor of the official newspaper at the command of the government in Vienna.

GALES, JOSEPH, JR. (1786-1860), American editor and congressional reporter. For more than fifty years, from 1810 till his death, Gales was an owner and editor of the Washington *National Intelligencer*—most of the time in association with his brother-in-law, W. W. Seaton. Until 1820 Gales and Seaton were exclusive reporters of the proceedings of Congress, the former sitting in the House, the latter in the Senate. They remained printer to both houses until Jackson became president. Their running reports, in the majority of cases abbreviated, were collected from the *Intelligencer* files and with other material enabled them to publish the indispensable source of early congressional history, *Debates and Proceedings in Congress, 1789-1824* (42 vols., Washington 1834-56), continued in the *Register of Debates in Congress* (14 vols., Washington 1825-37). As an editor Gales early gained wide influence because of his semi-official position. He was the recognized spokesman for the Madison administration and although of English birth warmly advocated hostilities with England in 1812. Later he became known as a conservative, supported J. Q. Adams against Jackson and together with Seaton made the *Intelligencer* one of the leading Whig organs. He espoused the cause of the United States Bank, protective tariff legislation and internal improvements and deprecated the antislavery agitation. For many years his editorials carried great weight, and Daniel Webster declared that his knowledge

of our governmental history surpassed that of all other politicians of the day combined. During the later stages of the slavery controversy, however, his influence declined as he persisted in adhering to his conciliatory views.

GALIANI, FERDINANDO (1728-87), Italian writer on political and economic subjects. Although born at Chieti, Galiani was educated at Naples. At sixteen he was already beginning to write, upon the basis of Vico's political doctrines, a number of treatises dealing with aspects of ancient economic and political life. He also translated Locke's treatise on money, adding notes which became the nucleus of his classical *Della moneta* (Naples 1750; new ed. by F. Nicolini, Bari 1916). The principal element which renders this treatise extraordinary among the economic writings of the time is its clear analysis of the question of value. Galiani makes the value of commodities—including the commodity money—dependent upon utility, or the capacity of an object to satisfy human needs, and subject to the modifying influence of scarcity, which he defines as the relation between the existing quantity of an object and the quantity desired. In the case of goods produced by human labor he points out that value is determined by the number of laborers required during the period of production, a cost which, however, will vary according to the factors fixing the normal value of the means of sustenance in question. Galiani manifests acute perception of the interdependence of the various elements affecting value; in his discussion of utility, in his gradation of human needs, in his realistic approach to the nature of these needs, he clearly anticipates later psychological theories of value. The year after the publication of his *Delle lodi di papa Benedetto XIV* (Naples 1758), noteworthy for its development of the theory of political passivism, Galiani was sent to Paris as secretary to the Neapolitan embassy. There his inexhaustible flow of wit made him an outstanding figure in the principal salons and brought him into intimate contact with the most influential Parisians of the time. When he was recalled to Naples because of a diplomatic error committed in 1769 he left behind his uncompleted but famous *Dialogues sur le commerce des blés* (London 1770), which created such a storm

of intermixed praise and criticism that Morellet was commissioned on behalf of the government to answer it. Despite Galiani's earlier adherence, at the time of the edict of 1764, to the cause of unlimited freedom in the export of grain he here showed himself a defender of moderate duties and a determined, although hardly solemn, opponent of the physiocrats, whose fundamental assumptions he challenged. During his ten years in France Galiani had at the same time identified himself with the problems of the French Enlightenment and kept intact his Italian heritage, the ideas of Vico and Machiavelli. In contrast with the theorists of natural law he maintained the historical, relativistic approach, holding it absurd to posit an absolute law, such as the primacy of agriculture, without regard to place, time and circumstance. While it was no doubt true that cosmic activities proceeded according to law (herein Galiani, even as an exponent of historicism, manifests his customary balance), the diversity of conditions evoked varying laws and produced varying results. The problem of the statesman was one of practical adjustment. An antidemocrat and pragmatist in the mold of Machiavelli, Galiani also had the elements of a utilitarian theory; he declared that it was possible by means of plotting an algebraic graph to discover the *maxima et minima*, the greatest good with the least pain. In one of his last works, *De' doveri de' principi neutrali* (Milan 1782), designed as an apology for the neutrality of Naples during the continental counterpart of the American War of Independence, he applied this formula to the problems of international law. Galiani's last years, passed at Naples in what seemed to him exile from France, were occupied with various official positions, which drew from him a number of significant reports on economic and political questions, with unofficial compositions on subjects ranging from politics to the Neapolitan dialect and with a voluminous correspondence with Madame d'Épinay and his other French friends. This correspondence (collected in *Correspondance inédite*, 2 vols., Florence 1818; new ed. Paris 1881) is the best mirror which has been preserved of his talents and point of view.

GALILEO GALILEI (1564-1642), Italian physicist and astronomer. Galileo occupies a twofold place in the history of science. He discovered most of the physical truths that were later embodied in Newton's great synthesis, and he vindicated the rights of modern science by his propaganda for the Copernican theory. It is from the second aspect that Galileo's work has direct significance for social thought.

While he had been converted to the Copernican theory in his student days Galileo did not become publicly identified with it until after he had made the astronomical discoveries which followed upon his invention of a telescope in 1609. These discoveries, such as the existence of the satellites of Jupiter and of the phases of Venus, added new weight to the Copernican theory, although they were far from demonstrating it completely; and in defending them Galileo soon found himself a vociferous champion of the new astronomy. Thus he brought himself into conflict with the Catholic church, which had withheld its censorship of the Copernican theory so long as that theory had been regarded as a mere hypothesis and so long as its implications had not been drawn. The reason for the Catholic opposition was not that the theory contradicted Scripture—so did the Ptolemaic system—but that it broke with the unity of doctrine which had hitherto existed between theology, ethics and science. For this unity Aristotle's philosophy provided the framework, and it had been possible to incorporate the mathematical epicycles of the Ptolemaic astronomy without disturbance to the rest of the structure. Galileo did more than defend an astronomical theory irreconcilable with the orthodox system of knowledge: he carried on a philosophical polemic against Aristotle's physical ideas which involved a direct attack upon the whole Aristotelian cosmology. Since the same reasons which made Aristotle's system ideal from the point of view of the Catholic

church made it deadly to scientific progress, Galileo was literally fighting for the right of science to exist.

In February, 1615, he was denounced to the Inquisition. During the investigation which followed it was intimated to him that he would go unharmed and everybody would be satisfied if he would teach the Copernican theory as a mere mathematical hypothesis of convenience. Galileo refused to accept a condition tantamount to maintaining the mediaeval suzerainty of theology over science, and in February, 1616, he was called before Cardinal Bellarmine, who informed him that the Copernican theory had been condemned by the Holy Office two days before and that he was henceforth forbidden to hold or teach the doctrine in any way. Although Galileo accepted and signed Cardinal Bellarmine's prohibition, it was impossible for a man of his intelligence to forswear a scientific opinion in his heart, and for a man of his temperament it was almost as difficult to refrain from writing about it. In 1624 he profited by the accession of Urban VIII to publish a covert defense of the Copernican theory. After this was well received he set to work on his great *Dialogues on the Two Principal Systems of the World*. It was the publication of this work in 1632 which brought about the attack upon Galileo by the Inquisition in 1633-34, his imprisonment, his trial and his tragic abjuration.

While a nominal victory for the church, the proceedings against Galileo really marked the end of the mediaeval era of the union of science and theology. It was not, however, until 1835 that the Catholic church explicitly rescinded the prohibition of Copernican teachings.

BENJAMIN GINZBURG

Works: Galileo's writings dealing with his defense of the Copernican theory are *Sidereus nuncius* (Venice 1610); *Il saggiaiore nel quale . . .* (Rome 1623); *Dialogo dei due massimi sistemi del mondo* (Florence 1632); as well as the letters to the Princess Christine and to Castelli. These may all be consulted in the national edition of his works, ed. by Antonio Favaro, 20 vols. (Florence 1890-1909). The *Sidereus nuncius* has been translated by Edward S. Carlos (London 1880), and the *Dialogo* and the letter to Princess Christine by Thomas Salusbury in his *Mathematical Collections and Translations* (London 1661). Antonio Favaro has published *Galileo e l'inquisizione: documenti del processo galileiano* (Florence 1907).

H. 1917) ch. ii; Wohlwill, Emil, *Galilei und sein Kampf für die copernicanische Lehre*, 2 vols. (Hamburg 1909-25); Wieser, Fritz, *Galilei als Philosoph* (Basel 1919).

GALL, FRANZ JOSEPH (1758-1828), German anatomist and founder of phrenology. Gall was born at Tiefenbrunn, Baden, and studied medicine in Strasbourg and later in Vienna, where he received his doctorate in 1785. He temporarily abandoned the practise of medicine in order to devote himself to the study of the brain and in 1796 gave public lectures in Vienna on the new doctrine of phrenology. The lectures were soon prohibited as subversive of religion and morality; and Gall thereupon betook himself to Berlin, where he inaugurated a similar course which did not meet with success. After making a tour through Germany, Denmark, Holland and Switzerland he settled in Paris; there together with his pupil Spurzheim he presented to the Institute of France in 1808 a memoir incorporating the results and conclusions of their researches. Cuvier and Pinel were members of the committee which returned an unfavorable report.

Although phrenology has been discredited as a science, Gall's work was not without merit. It was he who suggested the idea of brain localization, although his division of the cerebrum into faculties misled many psychologists until recent years. The interest and opposition which his theories aroused served to focus attention in biological and physiological circles upon important problems. Max Meyer has regarded him as a forerunner of behaviorism because he was not concerned with introspective psychology; and in his own day he was looked upon as a materialist because he placed so much stress on the brain as the organ of all psychic functions. Neither of these ascriptions is correct. He was a nativist in his philosophy, claiming that men are born with definite capacities and propensities. In contrast with the French naturalists, Cuvier, Bichat and Flourens, with whom he had scientific contacts and who discussed his views rather unfavorably, he did not attribute as much importance to the vital organs as to the brain. In his *Des dispositions innées de l'âme* he defended himself against the materialistic charges made against him.

Gall was a skilful controversialist and attracted a large number of followers, especially among persons without scientific training. Gaspar Spurzheim and George Combe did the most to promulgate his teachings in England and America, where phrenology as a profession thrived for over a century.

GALLATIN, ALBERT (1761-1849), American statesman, financier and scholar. Gallatin was born in Geneva, Switzerland, but at the age of nineteen, inspired by enthusiasm for nature and for liberty, he set out for America and on the banks of the Monongahela in western Pennsylvania established a frontier estate. An aristocrat by breeding, he soon became the political spokesman of frontier democracy. Without deep local attachments he consistently spoke the language of nationalism despite his affiliation with the party of decentralization. From his first appearance in the Pennsylvania legislature Gallatin displayed moderation, industry, eloquence, integrity, a genius for administration and finance, a painstaking attention to detail, a mastery of parliamentary tactics, an enlightened humanitarianism and a broad and farsighted conception of democracy. Entering the national arena in 1795 he was prominent in organizing and directing the opposition to Federalist policies during the Adams administration. As secretary of the treasury under Jefferson and Madison from 1801 to 1813 he undertook to translate the ideals of agrarian democracy into reality through the medium of "a wise and frugal government . . . which should not take from the mouth of labor the bread it has earned." His statesmanlike administration brought severe order into the business of the government and economy into its departments. He formulated a policy of debt reduction which despite the expense of the Louisiana Purchase and the Tripolitan war was singularly effective until the outbreak of the War of 1812. He was the first to show the fallacy involved in the old sinking fund idea as accepted by Pitt and Hamilton and also the first to introduce the custom of annual reports by the secretary of the treasury. Aside from economy and peace Gallatin's chief interest during these years was the creation of a public land system. In Penn-

sylvania he had applied the public lands to an extension of economic democracy and relief from taxation, and he had been largely responsible for passing through Congress the Land Act of 1796. As secretary of the treasury he planned the Cumberland Road and in 1808 submitted to Congress the plan for an extensive system of internal improvements and of national education to be financed by the sale of public lands. As a member of the American peace commission in 1814 Gallatin was largely responsible for securing the highly favorable terms of the Treaty of Ghent. From 1816 to 1823 he was minister to France, and as special commissioner to Great Britain in 1826 he settled outstanding differences between the two nations and negotiated a treaty of commerce. Later he presented with great skill the American case in two boundary controversies with Great Britain—the northeast and the Oregon.

After 1827 Gallatin resided in New York City, where he identified himself closely with the business and cultural life of the metropolis. As president of the National Bank of New York he exerted a powerful influence for sound banking and sound money, forcing almost single handed a resumption of specie payments after the panic of 1837. His ultrabullionist essays, which reveal a broad grasp of economic principles, were widely circulated by the National Bank. Always an ardent proponent of free trade, he presented in 1831 the memorial of the free trade convention of Philadelphia calling for a drastic reduction of tariff duties to conciliate the South Carolina nullificationists. He was president of the New York Historical Society and the most prominent of a group of citizens who founded New York University in 1831. His interest in the North American Indians had led him around 1824 to undertake an intensive study of their linguistic groups and to prepare an ethnographical map of North America. Under his influence the American Ethnological Society of New York was organized in 1842, and to the pages of its transactions Gallatin contributed two pioneer monographs on the geography, philology and civilization of the native races.

During the later years of his life Gallatin was out of sympathy with the current of American politics. He bitterly opposed the annexation of Texas and the Mexican War and sympathized with the antislavery crusade. In his old age he was an anachronism: a child of romanticism who lived to see the harsher realities of Jack-

sonian Democracy. "I find," he confessed in 1834, "no one who suffers in mind as I do at the corruption and degeneracy of our government."

HENRY STEELE COMMAGER

Works: *The Writings of Albert Gallatin*, ed. by Henry Adams, 3 vols. (Philadelphia 1879), vol. iii containing complete bibliography.

Consult: Adams, Henry, *The Life of Albert Gallatin* (Philadelphia 1880); Mai, Chien Tseng, *The Fiscal Policies of Albert Gallatin* (New York 1930).

GALLICANISM is a body of doctrines and practises designed to limit the papal power in France without removing the country from the fold of the Catholic church. During the *ancien régime* there were evolved two parallel and distinct types of Gallicanism, ecclesiastical and political. The former was maintained by the theologians of France, but in reality its doctrine referred less to France in particular than to Christendom in general. Its basic principles were that the bishops, who represent the successors of the apostles, are established by God no less than the pope, who represents the successor of St. Peter; that the government of the Catholic church is therefore a monarchy limited by the episcopal aristocracy; and specifically that the power of the pope is subject to the canons of the church and inferior to that of the general councils. Political Gallicanism, owing its development to the legal class, found its starting point in a principle as universal as ecclesiastical Gallicanism: that the spiritual and temporal powers although both derive from God must be strictly separated. But in fact it was chiefly concerned with defining the relations between the French king or state and Rome. It made two fundamental assertions: first, that the pope had no control over temporal affairs within the domain of the right Christian king; secondly, that he could not exercise his spiritual power in France without the consent of the king, whose authorization was required for the publication of all papal bulls and encyclicals.

The two types of Gallicanism were at once allies and foes. The principal point of contention was the matter of judicial prerogative. Violent disputes over numerous questions of jurisdiction raged between the ecclesiastical and the royal courts until gradually the latter and particularly the *parlements* acquired sufficient strength to establish their preeminent right. On the other hand, the bishops frequently joined the *parlements* in a common war against Rome for Gallican "liberties." By skilfully manipulating the

two parties and alternating his support between them the king was able to use them to his own advantage, either to further his control over the bishops or the royal courts as the case might be or to provide pawns for his own dealings with the papacy.

Although embryonic Gallicanism appeared much earlier in the writings of two archbishops of Reims, Hincmar (806-82) and Gerbert (c. 940-1003), later Pope Sylvester II, the doctrine received its first complete expression during the struggle between Philip IV and Pope Boniface VIII, carried on from 1296 to 1303. Bishops and lawyers united in upholding it; pamphleteers propagated it among the educated public; and the result of the controversy was the overwhelming defeat of Boniface by Philip. The next important stage in the evolution of Gallicanism merges into the conciliar movement, which grew out of the Great Schism. Profiting by the weakened state of the papacy two French theologians Pierre d'Ailly and Jean Gerson, inspired the Council of Constance (1414-18), at which the dignitaries of all Europe both ecclesiastical and temporal were represented, to set its official seal upon the doctrine that the general council was superior to the pope. When the Council of Basel a few years later sought to extend the victory won at Constance and under the leadership of certain radicals made exaggerated demands for control over the papacy, Christendom reacted against the conciliar movement. Nevertheless, in France the result of the movement was the recognition by King Charles VII of episcopal rights. Through the Pragmatic Sanction of Bourges, a joint act between Charles VII and the bishops entered into in 1438, the French church became a virtually autonomous organization, the bishops being elected by their chapters and the abbots by their communities. The Pragmatic Sanction remained in effect, although submitting to occasional modifications, for nearly eighty years; and the doctrine of ecclesiastical Gallicanism which it represented was reenforced during the reign of Louis XII (1499-1515), who finding the bishops valuable allies in his war against Pope Julius II encouraged an outburst of pamphlets asserting their position. But in 1516 Louis' successor, Francis I, who desired to live at peace with Rome, superseded the Pragmatic Sanction by a concordat with Leo X, according to which he sacrificed the interests of the bishops in an arrangement highly advantageous to himself. The concordat endured as the definitive settlement until 1789 and the period marks the

effective realization of political Gallicanism. The bishops, far more shackled by the king, who according to the provisions of the concordat appointed them, than by the pope, who merely invested them with the spiritual insignia of their office, were soon reduced to a state of virtual vassalage to the crown. The king distributed bishoprics as favors in the families of his ministers, courtiers or officials and the recipients gave divers marks of their gratitude. Frequently they lent him financial assistance out of the very considerable incomes which their offices entailed, and always they supported him in his claims against Rome.

The coalition between monarch and bishops was officially recognized by the French church in the seventeenth century, when ecclesiastical Gallicanism received its classical expression from its most eminent representative, Bossuet. As promulgated at the Clerical Assembly of 1682, Bossuet's manifesto declared in its first article that the pope is without power in temporal affairs. The other three articles asserted that in matters spiritual the pope must respect the canons of the general councils, that in matters of faith his judgment becomes infallible only after receiving the approbation of the church, and finally that the Gallican church is entitled to preserve its traditional usages. During the seventeenth century and continuing through the eighteenth the theory of political Gallicanism on its side was being constantly restated and buttressed by the innumerable writers who commented upon the famous *Les libertés de l'église gallicane* (Paris 1594) of Pierre Pithou. How strong was the allegiance of the articulate French public to the settlement sanctioned by the concordat became apparent when Louis XIV in his declining years abandoned the uncompromising Gallican policy of his prime and solicited the assistance of the pope against Jansenism. The bull *Unigenitus* of 1713, the condemnation of Jansenism with which the pope gratified Louis' request, aroused a storm of opposition which raged from the *parlements* as a center for thirty years. Gallicanism had indeed achieved such tremendous prestige in the eighteenth century that it stimulated imitation outside France. In Germany Bishop Hontheim (1701-90) instituted a movement known as Febronianism (from Hontheim's Latin pseudonym) modeled on ecclesiastical Gallicanism; while in Austria Emperor Joseph II thrust upon his hereditary dominions a replica of political Gallicanism which acquired the name of Josephism.

At the beginning of the French Revolution the Constituent Assembly of 1789 demolished the first estate as a privileged corporation; but it continued to be dominated by the essence of the Gallican tradition, the idea that the French church should be a national church. The Civil Constitution of the Clergy, by which the Assembly in 1790 reorganized the government of the church, was an attempt to strengthen that tradition. Contrary to expectation the Civil Constitution, which made the appointment of bishops and curés dependent upon popular election and transferred their salaries to the national budget, instituted a reactionary movement among the faithful, bringing the militant Catholics closer to Rome. The war thus unbridled between the revolution and the church continued until Napoleon negotiated the Concordat of 1801. According to the provisions of this pact Napoleon and Pope Pius VII agreed to reinstate the system established by Francis I for the appointment of bishops. That Napoleon really intended to extrude the influence of the papacy from the national church was amply demonstrated when he supplemented the concordat, without the consent of the pope, by the Organic Articles, which under the guise of police regulations gave him extensive powers of interference in the affairs of the clergy. But in authorizing and even forcing Pius VII to depose those prelates either émigré or constitutional who refused to resign in order to make way for the new regime of the concordat, Napoleon made a compromise with ultramontaniam, the effects of which were never eradicated.

The mortal blow to Gallicanism was the transformation of the denominational state into a lay state. This process, begun by the revolution and continued under Napoleon, who refused to concede that Catholicism was more than the "religion of the majority," was finally consummated after the Catholic reaction of the restoration by the July Monarchy, which recognized the equality of all religions. Henceforth ultramontaniam made rapid progress both among the clergy and the faithful of the laity. When at the Vatican Council of 1870 the papacy for the first time in history ventured a formal denunciation of Gallican doctrines, few French Catholics resisted his fiat or sought escape by joining the ranks of the Old Catholics in Switzerland.

But while the Gallican doctrine is obsolete it has been survived by the Gallican spirit, which certain Catholic groups hostile to papal intervention in French politics have perpetuated.

Examples of such groups are the "rebellious royalists" who violently opposed the suggestion of Pope Leo XIII that they affiliate themselves with the republic; and the royalists of the Action Française, whose wrath has been aroused by the condemnation of their doctrines pronounced by Pius XI in 1927.

GALLIÉNI, JOSEPH-SIMON (1849-1916), French colonial administrator. Galliéni, a military *colonial de carrière* with a long experience, landed in Madagascar in 1896. Earlier in his career he had secured the treaty of 1881 with Ahmadou and in this Niger protectorate had worked out the "policy of races" which was to transform Madagascar. During the years from 1891 to 1895 he had subdued the remote provinces of upper Tonkin by a system which consisted of a gradual percolation of territory by non-military influences and which became widely known under the nickname *tache d'huile*. At the time of his arrival in Madagascar the colony was the determinant of French colonial policy, and during his nine years there he introduced an administrative technique which has since become the normal French practise. Breaking with the accepted colonial tradition of "assimilation" and ruthless exploitation in the exclusive interests of the mother country, his administration relied on more generous protectorate methods and on the *tache d'huile* system. He held that military conquest, while an essential preliminary to constructive organization, should be strictly subordinated to political pacification. In carrying out these principles Galliéni evolved an elastic policy which allowed each native race to develop to the limit of its possibilities. This policy—later called associa-

tion or the collaboration of races by the French and indirect rule by the British—transformed Madagascar. "Galliéni received an insurgent forest," wrote Gabriel Hanotaux; "he made it a tranquil and prosperous colony." His program—even in such details as social taxation and agricultural education—was ahead of his time and at present is advocated as the ideal native policy for progressive colonial powers. It was this innovation which made Madagascar the seminar of a new system of dealing with native races and which, a successful military career notwithstanding, remains Galliéni's chief claim to fame.

GALLUPPI, PASQUALE (1770-1846), Italian philosopher. Galluppi's works are concerned chiefly with the problem of knowledge and with discovering a way out from subjectivism, which he still found in Condillac and Kant, in the direction of an objective doctrine of reality. But he also felt a lively interest in practical problems, and from his conception of an autonomous ethics he was led under the aegis of Filangieri to expound a theory of political liberalism. The state he defined as the guardian and champion of the natural rights of the citizen. It cannot compel its subjects to act against the dictates of conscience and hence cannot deny them civil and religious liberty. All the state can do is to limit the outward manifestations of these rights. Applying this principle to worship Galluppi defended the right of nonconformity and declared that the state can protect public worship from attack, but it can neither impose nor prohibit it. From this right of nonconformity Galluppi concluded that the concordat which left the control and regulation of marriage in the hands of the Catholic church as a sacrament was a violation of the natural right of the citizen. This for the time and place in which it was enunciated was a very bold and advanced idea.

GALT, SIR ALEXANDER TILLOCH (1817-93), Canadian business man and statesman. Galt was born in London and entered Canadian life in 1835 as a clerk in the office of the British American Land Company organized by his father, John Galt, which held over a million acres in what is now the province of Quebec. Within nine years he was in control of the highly successful colonizing company. Availing himself of the opportunities offered by increasing settlement and economic development, Galt went on to industrial undertakings and later into railway promotion. He became the outstanding figure in the railway activities of the fifties, interested chiefly in the roads which eventually became part of the Grand Trunk system.

It was then a short step from business to politics. Galt entered Parliament as a Liberal in 1849 and with one brief gap held a seat until 1872. He was throughout more a pioneer in policy than a leader of parties. Declining the premiership in 1858 he forced the Cartier-Macdonald ministry, which he entered in that year as minister of finance, to adopt the policy of federation of the scattered British North American colonies. His terms as finance minister, which were marked by administrative efficiency, saw the accomplishment of debt consolidation and the introduction of decimal currency. In spite of his free trade leanings he advocated "incidental protection" and achieved fiscal independence by his successful insistence on the right to tax British imports.

Galt was the most influential factor in shaping the details of the federal scheme which came into force in 1867. After confederation he served as first dominion minister of finance, advocating independence and later imperial federation, neither of which was adopted although both were present in the eventual synthesis of independence within the British Commonwealth of Nations. In the seventies he carried on a vigorous campaign against the ultramontane tendencies of the Roman Catholic church, expressing his views in two brochures, *Civic Liberty in*

Lower Canada and Church and State (Montreal 1876). His detached outlook gradually led him into international affairs as Canada's ambassador-at-large. He was the dominant member of the Halifax Commission, arbitrating the financial phase of outstanding fisheries questions between the United States and Canada. He became the dominion's foremost diplomat and in 1880 was appointed first Canadian high commissioner to London. Returning to Canada Galt devoted the final years of his life to the opening of the far west, in which he again demonstrated his lifelong trait of being in the forefront of decisive Canadian developments.

GALTON, SIR FRANCIS (1822-1911), English psychologist and eugenicist. Galton, a grandson of Erasmus Darwin, was born near Birmingham. After studying medicine at the Birmingham Hospital and in King's College, London, he was graduated in 1844 from Trinity College, Cambridge. He traveled extensively as a young man, especially in the Sudan and in southwest Africa. He never espoused an academic profession or specialty but preferred to direct his interests at different times to the diverse fields of anthropology, psychology, meteorology, genetics, natural history and criminology.

Galton has been most influential through his work in eugenics, a movement which he inaugurated in 1905. He founded a laboratory of eugenics at the University of London and at his death left to the university a fund for a professorship in the subject. His studies of genius and heredity, in which he failed to distinguish sharply between biological and cultural determinants of character and success, have had great influence upon later writers on heredity. In psychology he discovered the existence of imaginal types, initiated that branch of the science which deals with individual differences, and administered tests. He did important work in anthropometry and biometry, originating the process of composite portraiture and performing painstaking researches on fingerprints. It was largely through his efforts that Bertillon was persuaded to introduce the fingerprinting of convicts as a means of identification. His work on correlations has given the impetus to many investigations of a functional character in the field of education.

Galton was not erudite. His forte was not analytical philosophical analysis but vivid literary description and the social application of his laboratory findings. He was essentially a social reformer.

GÁLVEZ, JOSÉ DE, MARQUÉS DE SONORA (1720-87), Spanish statesman. Galvez studied law at the University of Salamanca and later practised in Madrid, where in 1764 he was appointed a municipal justice.

He was chosen visitor general of New Spain and an honorary member of the Council of the Indies in 1765. As visitor he inspected the departments of government in Mexico in order to improve administration and increase the revenues. He centralized the collection of taxes, established the tobacco and other monopolies and reduced speculation among financial and customs officials. He also helped to expel the Jesuits from Mexico in 1767, took measures for the defense of the realm and provided for the pacification of the north Mexican provinces. The frontier provinces were organized into the *comandancia general*, and, in 1769, upper California was occupied under his orders.

In 1775 he was appointed minister of the Indies and governor pro tempore of the Council of the Indies, with the right to vote in the absence of the president. As minister Gálvez considerably improved the whole colonial administrative system by carrying out the reforms he had suggested as visitor general. One of his greatest measures was the systematization of the administration of the colonies through the decree of 1786, which organized them into uniformly governed intendancies. This reorganization was especially directed toward greater centralization and the reform of the fiscal system and put new vigor into the decadent colonial administration. The system of restricted free trade,

established by Gálvez' *reglamento* of 1778, produced an era of prosperity in the colonies. In 1780 Gálvez became a member of the Council of State.

GAMA BARROS, HENRIQUE DE (1833-1925), Portuguese historian. Gama Barros received his degree in law from the University of Coimbra in 1854. In the course of his successful career as a public official he held the office of secretary general and civil governor of the district of Lisbon in 1876 and again in 1878 and was president of the Tribunal de Contas, the highest administrative body in Portugal, from 1900 to 1910. He was connected with the liberal reform movement led by João Franco and in 1906 was made a peer of the realm with membership in the upper house. He was an active honorary member of the Academy of Sciences of Lisbon.

Gama Barros' chief work is the *Historia da administração publica em Portugal nos seculos XII a XV* (4 vols., Lisbon 1885-1922), a vast, thoroughly documented, analytical study of Portuguese social life in the Middle Ages. It begins with a description of the legal systems that governed mediaeval society; Visigothic, customary, charter, canon and Roman law and the general laws promulgated by the first Portuguese kings are explained. Royalty as the central organ of this society is studied in detail, with discussion of the extent of the king's power, of the advisers and officials who assisted him and of the limitations set to his arbitrary power by the Cortes and the immunities of the different classes. Interspersed are pages of critical comment on the old problem of the existence of feudalism in the Iberian Peninsula. A great deal of space in the first two volumes is devoted to a treatment of the various social classes, military organization, the Cortes and the economic and social life of the period. The third volume is a treatise on the regulation of various types of property rights, including possession, fishing, hunting, mining and prescriptive rights. Contracts, inheritance, tenancies and protective legislation are also dealt with. The last volume is devoted to agriculture, commerce and industry, the treatment of which, because of the author's intimate contact with original and largely unedited documents, is distinguished by its originality. Gama Barros'

scholarly work has had great influence and has given its author a leading place among the prominent historians of both Portugal and Spain.

GAMBETTA, LÉON (1838-82), French statesman. Gambetta, a Genoese by birth, went to Paris in 1857 to study law and soon became known for his impassioned oratory and his hatred of the imperial regime. His contributions to the new *Revue politique et littéraire* gained for him a larger hearing, and in 1869 he was elected deputy. With Gambetta in the *Corps législatif* the popularity of Thiers' oratory was overshadowed. Like his older rival Gambetta opposed the Franco-Prussian War but once it had been declared he became the great patriotic orator of France. After the revolution of September 4 Gambetta as minister of the interior undertook the reorganization of the French army in the provinces. He came to regard himself as the defender of the frontiers and of the liberties of the people and opposed the peace counseled by Thiers. Gambetta's republicanism resembled that of the Restoration although he was always the advocate of legal and peaceable means. As long as the menace of a monarchical restoration remained, he was identified with the extreme Left, but when this likelihood was passed he used his great influence to rally moderate men to the republican idea. He advocated universal suffrage as a prerequisite to national sovereignty and upheld the principle of a powerful Chamber of Deputies elected by the nation and checked by an upper house. An uncompromising champion of religious toleration, he frustrated the attempt begun under MacMahon's regime to restore the power of the Catholic church. After Thiers' retirement Gambetta was the outstanding statesman of the young republic and upon the resignation of MacMahon was proposed as a presidential candidate. He refused, however, to allow his name to be brought before the National Assembly. Several months before his death, in 1882, he formed a ministry that was short lived. Gambetta in his later years was a strong advocate of a new colonial and foreign policy for France. He advised the establishment of a firm alliance with Great Britain and a policy of cooperation with that country in its Egyptian activities. The Freycinet cabinet,

however, lacked the courage to follow his counsel.

GAMBLING

GENERAL AND HISTORICAL. The term gambling designates the deliberate wagering or staking of important or valuable considerations upon events which, so far as the parties to the wager can know, lie in the realm of pure chance, or "luck," to use the more or less mystical conception of chance common among gamblers. Games of chance are widely found among primitive communities. They are associated in the primitive mind with the disposition to personify all consequential objects and facts and to attribute events to the work of good or evil spirits. This animistic apprehension of things, which assumed the form of a widespread belief in luck, was and is a very persistent human attribute and constitutes an extremely important element in gambling. To the barbarian bent upon some perilous venture the disposition of the guardian spirit was of preeminent importance. His standing with the favoring or disfavoring deities was presumably disclosed by the results of situations of chance. In fact, the instruments of gambling were frequently used for divination. As the propitious gods shaped circumstances to insure the individual's triumph over the hazards of uncertain existence, they also directed the instruments of chance so as to reward their favorites.

As primitive man gradually came to regard certain aspects of his environment in terms of mechanical cause and effect, gambling became a more specialized activity and in its practise the animistic apprehension continued to enjoy free exercise. An individual had the favor of the deities, or was lucky, when the machinery of chance reacted in his favor. A wager almost invariably fortified his feeling of good luck, for it seemed unlikely to him that the forces com-

monly friendly to his interests would desert his cause in face of a generous display of faith in their benignity. The tense alertness induced by the suspense involved in the gambling situation exhilarated the human organism and very often may have enabled it to accomplish feats otherwise impossible. No doubt this contributed greatly to the persistence of the belief in animism or luck. A belief in luck is anachronistic in a machine age, but nevertheless it persists and goes far to explain the extent to which men still indulge the passion for gambling.

The line between gambling and other activities is often hard to draw. Even in the most static circumstances chance plays an important part in the distribution of gains and losses; and wherever the factor of pure chance can be segregated, activities that are essentially gambling may develop. Ordinary commercial transactions involve calculations based on rational data as to the future course of the market; but the data are never exhaustive, and in default of certainty action may be dominated by a spirit of "plunging" virtually identical with gambling. It is particularly difficult to distinguish the gambling element from others in the specialized transactions known as speculation.

In its simplest form speculation is the act of buying or selling commodities, securities or rights in order to benefit from changes in their prices. In so far as the speculator is governed by rational calculations based on factual data, however inadequate, the transaction is essentially commercial. When he buys or sells simply in the blind hope that the market will turn his way he is gambling. In some jurisdictions the legal distinction turns on the point of bona fide delivery, as on the organized exchanges. Bucket shop transactions are readily and correctly classified as gambling, since they are nothing but betting on the changes of prices. Where delivery is made the gambling element may still predominate, especially where speculation is carried on with perilously narrow margins. As in a lottery, a small sum, although it will probably be lost, may possibly yield enormous gains.

Of purely gambling activities the simplest are those for which the circumstances of chance may be reestablished easily and frequently at the will of the participants and in which the elements of skill and foreknowledge of the outcome are reduced to a minimum. These requirements have contributed greatly in ancient and modern times to the popularity of the die and its variations. For the same reasons simple games of

cards, in which the results are more dependent on fortuitous distribution than on the skill of play, have enjoyed wide popularity among gamblers. In simple dice and card games the duration of suspense and uncertainty between the casting of the dice or the dealing of the cards and the examination of the results is relatively short and allows frequent repetition. Such games are often the chief forms of gambling offered by public gambling houses and have been favorite subjects of ingenious although futile schemes for defeating the laws of probability.

More complicated games and feats, requiring fortitude and skill, have frequently acquired importance as gambling opportunities. These games may be indulged in for their own sake, and when wagers are laid they are as often laid to heighten the winning side's ascendancy at the cost of the loser as they are for profit. Sometimes this love for emblematic representation of prowess is satisfied by a very mild sort of gambling in the form of prizes for the winners. Where the gambling feature emerges as one of the most important features of the contest, the element of pure chance is segregated so far as practicable through odds and handicaps which neutralize the effect of the differing degrees of skill possessed by the contestants. Within this class of gambling situations would be included sedentary games and athletic contests, in which some of the partisans may participate directly in the play, and also horse racing and animal combats, where the partisans simply sponsor one side.

Testimony before the subcommittee of the United States Senate Judiciary Committee in 1920 held that race track gambling in the United States resulted in wagers amounting to \$230,000,000 annually. In view of the fact that race track gambling is legal in only four states of the union, these figures proclaim the existence of an efficient and far flung under cover organization which is further attested by the ever present "dope" sheets and bookmakers throughout the country. In Great Britain, where race track gambling is the most popular form of gambling in connection with sports, testimony before the House of Commons Select Committee on Betting Duty in 1923 variously estimated that in spite of laws designed to curtail such gambling from £75,000,000 to £500,000,000 was wagered annually on horse races and sports. Public betting in Great Britain was conducted almost entirely through bookmakers until after 1926, when financial difficulties moved the government to tax race track gambling and in order to simplify

the collection of taxes to authorize the adoption of the *pari mutuel* gambling machine. This machine automatically records the bets and determines the odds in accordance with the relative popularity of the different entries among the bettors. Although perhaps occupying a relatively less important position as a gambling opportunity, horse racing is quite popular in France and accounts for a substantial amount of betting. Race track gambling is legally permitted in many other countries, among them Australia, Belgium, Canada, Cuba, India, Italy and Mexico.

In recent years there has developed in the United States a form of public gambling which in its illegality and complicated under cover organization, with thousands of agents and millions of participants, resembles the surreptitiously conducted race track gambling. There are several variations of the conditions of chance employed and the games have different names, such as policy games, numbers and pools. They are in fact lotteries which pay on number combinations taken from the published records of bank clearings, the United States Treasury balance, the total number of runs scored each day by various combinations of baseball teams and so forth. These lotteries are designed primarily although not exclusively for players of small incomes, and wagers as low as one cent are frequently accepted. In this way millions of dollars are wagered annually.

The gaming tables formerly so popular in England, in Germany and on the American western frontier have largely passed from public view. They have been suppressed by law in England and Germany; and in the United States Nevada is now the only state which legally sanctions the public gambling house. That such enterprises exist surreptitiously, however, is a matter of common knowledge and is formally evidenced by the occasional disclosures of law enforcement bodies. An indication that many citizens of those countries in which public gaming tables are illegal are not opposed to this type of play is to be found in their presence in the gambling casinos in Mexico, Cuba and some of the countries of Europe where such gambling is permitted under a licensing system.

In 1902, after Belgium passed a law prohibiting public gambling houses, Monaco stood alone as the only country in Europe openly permitting them. Today the casino at Monte Carlo is still one of the most popular in the world, and the little principality of Monaco secures practically all of its revenue from gaming tables. Hundreds

of thousands of visitors are attracted annually by the mere existence of the casino and these visitors spend huge sums at hotels, cafés and shops. The annual government charge for the gambling concession was £80,000 in 1917, £90,000 in 1927 and will be £100,000 in 1937. The "take" in 1928 was \$5,766,104 while the net profits were \$3,227,213. The attraction which Monte Carlo holds for tourists has loosened the ban in France so as to permit competing gambling casinos. French casinos enjoyed a combined annual income of approximately 400,000,000 francs from 1926 to 1929 and numbered 169 in 1931. Since the World War Italy in her effort to attract and to hold tourists has licensed two such establishments. In 1930 the Free City of Danzig on the Baltic, in an endeavor to share in the gambling revenues, licensed an international gambling association for a consideration of 1 per cent of the funds received by the association.

But the gaming communities described above are frequented chiefly by the aristocratic and moneyed elements of society. Although such gaming has attracted most attention because of the dramatic qualities attached to it, gambling among the masses and in the middle class represents a more pervasive influence. Card playing for small stakes is a common accompaniment of middle class social life; small bets on horse racing and the policy and number games are diversions of the masses; and card and dice games have found their way down to the juvenile gangs and the street trades. The earliest opposition to gambling seems to have manifested itself when it began to interfere with activities which in the opinion of the ruling authorities should have first claim upon the time and energy of the masses. In ancient communities laws were passed to discourage the masses from gambling, and at later dates antigambling laws were aimed especially at the activity as practised by the working classes. An edict of the provost of Paris in 1397, for example, specifically prohibited working people from playing tennis, bowls, dice, cards or ninepins on working days.

Present day movements to suppress gambling are also tinged with the opposition that is shown toward anything which impairs the usefulness of the masses. The willingness of people to impose prohibition of gambling upon themselves and others regardless of social status, however, obviously includes other considerations. Gambling sets at defiance the bourgeois philosophy which holds that private property is something which the individual has earned and which in the na-

ture of the case tends to be commensurate with the service rendered. Rewards which are determined by chance have no place in a system based upon such a premise. It is interesting to note that the opposition of the leisure class to gambling within its own circle has never been very pronounced. To the members of this class riches have a more direct relationship to inheritance than they do to personal efficiency in conventional industrial and commercial operations, and therefore the bourgeois philosophy has exerted less influence. In well settled societies where it is virtually impossible for the ordinary worker to save enough to rise out of his class gambling, particularly in forms involving great prizes on small stakes, as in lotteries, is extremely popular among the unpropertied classes. In most of Europe it is widely regarded as the duty of the head of the household to acquire a chance in every lottery drawing.

Gambling is incompatible with Puritan ascetism, which (unlike Catholic asceticism) was carried into the workaday world in the form of industry and frugality. The acquisition of property according to the Puritan outlook was not supposed to be the result of chance, but the evidence of work for the glorification of God. The result was that an accumulation of material goods came to be regarded as symbolic of the attainment of divine grace by the possessor. In urban communities in the past few decades the purely religious opposition to gambling has tended to become less violent. This is partly the result of the difficulty of maintaining a hostile attitude toward the conventional category of gambling when certain activities, highly reputable according to prevailing social standards, have come more and more to resemble it. The religious opposition to gambling is still conspicuous, however, in those communities where Puritanism persists, and may even be extended to opposition to devices usually associated with gambling even when not used for that purpose.

At all times an important factor in arousing antagonism to gambling has been the association, almost inevitable, with sharp practise. Loaded dice are as old as recorded history; marked cards, sleight of hand manipulations in play, machines rigged to the advantage of the house, race horses "doped" or "sponged," prize fighters bribed by insiders to "throw" the bout, false tips in the bucket shops—such devices are innumerable. The very existence of the professional gambler is evidence of the ease with which crooked practises may be applied.

In recognition of the constant temptation to trickery gambling has developed everywhere codes even more rigorous than are applied to ordinary business transactions. The merchant is easily forgiven even grave misrepresentation of the quality or value of goods. Similar over-reaching in gambling, if detected, carries disgrace and ostracism. In comparatively recent times in the western United States it was not unusual for each party in a poker game to have on the table at his right hand a pistol loaded and cocked for use on the first evidence of cheating. Manslaughter in such circumstances was condoned by the community, even when the killer was a professional gambler covering his dishonesty by murder. How common the civil disorders associated with gambling may be is indicated by the colloquial designation of gambling resorts as "hells." Such resorts may continue to operate in spite of their repute, because the constant movement of population brings ever new victims.

Only in new societies, particularly mining camps, do the public authorities ignore gambling altogether. In established societies more or less serious attempts are everywhere made either to prohibit or to regulate gambling in its more notorious forms. Such regulations are among the most difficult to enforce adequately even by an honest and intelligent police administration because of the ease with which gambling operations can be carried on under cover and because of the extremely spasmodic interest of the public in the suppression of gambling. The administration of gambling laws and regulations lends itself readily to the practises of political corruption, since the outlawed position of both victim and exploiter offers the latter unexampled opportunities for plunder which in times of public apathy may be made entirely safe by the purchase of police tolerance.

COLLIS STOCKING

LEGAL ASPECTS. The law of gambling comprises two types of aleatory transactions: gaming and wagering. Both the criminal and the civil law have dealt with gambling but often upon mutually inconsistent principles. The criminal law has shown a greater instability than any other type of moral legislation. The civil law has been bedeviled by the impossibility of distinguishing objectively between a wager and the contingency of an ordinary business contract. At one time insurance contracts lent themselves particularly to gambling. Contracts of security were once regarded fundamentally as wagers and

the pledge was treated as a stake, as is shown by the terms *wadia* in the Lombard law and *Wette* in the early German law.

Very little is known of the ancient law of gambling. The penal provisions of even the Roman law remain very obscure. Indeed it seems that at the end of its development the Roman law discouraged gambling only civilly. It distinguished between prohibited and permissible games. The latter were certain sporting or war-like games (*si quis certet hasta, vel pilo iaciendo vel currendo, saliendo, luctando, pugnando, quod virtutis causa fiat*), but the stake could never amount to more than one *solidus*. No action would lie to recover money won at prohibited play or a wager upon an illegal game. A leading feature of the Roman law was that it allowed gambling losses to be recovered. The owner of a house who allowed gambling in it could not sue because of any injury to his person or property during the progress of play, but a right of redress existed as among the players themselves.

A well known passage in Tacitus (*Germania*, 24) describes the gambling fever of the ancient Germans, who would stake not only their possessions but their very liberty at dice. The utmost gambling freedom continued to prevail legally among all the Germanic peoples in the centuries after the dissolution of the Roman Empire. In both the Germanic laws and the early English common law gambling debts were normally collectible and wagers enforceable, but at common law the keeping of a common gambling house was indictable as a public nuisance. The bewildering profusion of legislation does not begin in European countries until the later Middle Ages. In England the earliest statute appeared in 1388 (12 Rich. II, c. 6); in Germany, in 1207 in a law for the town of Regensburg; in Austria, in the Salzburg *Landesordnung* of 1328; in France, in two ordinances of Louis IX in 1254 and 1256 respectively.

Most of these postmediaeval statutes may be described as police legislation. Sometimes playing at certain times or places might be regulated; thus playing at Christmas might be allowed, while playing in an inn or tavern after curfew time might be prohibited. Some provisions permitted gambling in prisons, which at this time did not offer their inmates any other occupation. The class stratification of the passing Middle Ages showed itself in numerous laws which sought to measure the permissible size of stakes for gentleman, burgher or servant. But often certain games might be prohibited altogether,

and these might include not only cards and dice but such games of skill as are now generally regarded as innocent; for instance, quoits, ninepins, billiards, bowling or tennis. But the motive of such legislation was less to save the subject from ruin than to direct his energies to games of military vantage. Thus the ordinance of Philip the Fair of 1319 interdicted games which distracted men from military drill; the ordinance of Charles V of 1369, which forbade games of chance, enjoined practise with the bow or cross-bow. So too did the first English statute of 1388; and the statute of 1541 (33 Henry VIII, c. 9), which is still the basis of the English law of gambling, was entitled the Bill for Maintaining Artillery, and the Debarring of Unlawful Games.

The present criminal law of England with respect to gambling is a conglomeration of statutes old and new. Under the surviving provisions of the statute 33 Henry VIII, c. 9, no games are made absolutely unlawful in themselves, but it is criminal to keep a gaming house for the purpose of playing at games of cards or dice or any other game which is unlawful. Various subsequent statutes expressly declared certain games to be illegal in themselves, for instance: the ace of hearts, faro, basset and hazard by the act of 1738 (12 Geo. II, c. 28); the game of passage and other games with dice except backgammon by the act of 1739 (13 Geo. II, c. 19); and roulette by the act of 1744 (18 Geo. II, c. 34). The most important modern act, the Gaming Act of 1845 (849 Vict., c. 109), expressly excepted games of skill. The keeping of a gaming house is still indictable at common law, but prosecutions are usually had under a long series of statutes intended either to broaden the basis of complicity or improve procedure. A private club, such as the famous Tattersall's, has been held to be within the law. By the Metropolitan Police Act of 1839 (2 & 3 Vict., c. 47, § 48) the players in a gaming house may themselves be liable. By the Betting Act of 1853 (16 & 17 Vict., c. 119) a common betting house was assimilated to a common gaming house.

In the United States the common law has also been almost completely superseded by plentiful statutory provisions, which run particularly to the blue law type. Many laws are aimed at specific games, and sometimes playing for excessive stakes is prohibited. A great deal of legislation relates merely to the time, place or circumstances of play. A favorite form of American legislation is aimed at the act of keeping gambling implements. In recent years many laws

have either prohibited pool rooms altogether or regulated them stringently. The opportunity for gambling provided by such a sport as boxing has motivated antiboxing legislation in some states. A growing amount of legislation is specially directed against slot machines and punch boards.

Probably the chief difference between the modern English law and the continental criminal law of gambling is formal. The provisions of the penal codes are few and brief, with the result that the continental law is largely jurisprudential; despite many textual differences continental courts tend to reach much the same results. The French and Belgian codes speak of keeping a gaming house; the Italian, of conducting a game in a house; the Austrian, of allowing a game of chance in one's place; the German, of running a game of chance as a business; but such provisions tend to become assimilated under the general doctrines of the criminal law. The conduct of a game of chance in a street or public place has also been a common object of prohibition. The German code expressly extends to gambling in a private society or club, but the same result seems to have been achieved jurisprudentially in France. Express provision, however, is necessary to make the players as well as the professionals in a gambling house liable, a course taken by the German, Austrian, Italian and Norwegian codes. The inclusion of the players was one of the objects of the amendments to the German penal code in 1919 which were dictated by a post-war gambling fever.

The Austrian and Norwegian codes attempt something in the way of a general definition of a game of chance, but irrespective of such statutory prescriptions it seems everywhere to be considered as any game in which chance preponderates; thus mixed games of skill and chance are reached. The Austrian code expressly excepts games played for mere amusement, but the innocence of such games has been generally recognized by decisions. The tests are the size of the stakes and the social position of the players. The codes generally contain no express provisions as to betting, but the courts have nearly everywhere assimilated betting to gaming for all practical purposes. Betting becomes criminal when it is indulged less from motives of sustaining opinion than from the desire to gamble and particularly when it assumes indiscriminate or organized forms. In the determination of the legality of particular games or betting transactions the continental law as a result of the silence of the codes is far more flexible than the English.

Indeed the law of czarist Russia generally forbade games of cards or dice or similar games but left it to administrative order to determine the criminality of particular games; this is still true in Austria, where the practise goes back for several centuries.

In continental countries the prohibition of gambling has always had something of a police rather than a truly penal character, for since the mediaeval period gambling houses have often been legally allowed by the sale of governmental concessions at the same time that they have been forbidden by the general criminal law. Whatever scruples may have existed were sometimes satisfied by providing that a part of the revenues should go to eleemosynary purposes, a practise that still sometimes obtains with respect to gambling forfeits. Particularly in eighteenth and nineteenth century France and Germany did the gambling casino become almost a settled feature of the famous watering places or resorts. Gambling casinos were finally abolished in Germany at the time of the formation of the North German Confederation in 1868; the prohibition went into effect in 1873. The Swiss federal constitution of 1874 also interdicted gambling banks but apparently roulette was nevertheless allowed in the large Swiss cure centers until 1925. France has at various times prohibited gambling casinos but has restored them. The most famous of all modern gambling casinos is that at Monaco. Nevada, which in 1931 legalized public gambling, is the only American state to have done so, but elsewhere gambling in political clubs has been virtually privileged; indeed the use of the injunction against police interference is not unknown. Lotteries (*q.v.*) also represent a legalized form of public gambling in many countries.

The most important form of modern organized betting is in connection with horse racing. In England the Betting Act of 1853, which declared a common betting house a criminal resort, simply drove the bookmakers to the street. Both the French and German courts held bookmaking to be criminal under the codes but also to no avail. These countries as well as many others have legalized betting on the races in one form or another. France first did so in 1891, Germany in 1905 and England in 1928; in the last named country the action was no doubt partly a result of post-war budget difficulties; wherever betting has been legalized the rate of taxation has been very high and the yield large. In the United States race track betting is now legal in Kentucky, Illinois, Maryland and Nevada. The bet-

ting scheme which has most frequently been allowed is either the *pari mutuel* or the totalizator, but recently European countries tend also to permit licensed bookmakers. New York which once allowed race track betting, has not only repealed the enabling law but embodied a clause against the practise in its constitution.

Upon the civil side modern European countries, despite the general reception of the Roman civil law, have followed its example only in part. After much vacillation the Germanic idea that a gambling debt was a debt of honor triumphed in the end in the *Bürgerliches Gesetzbuch* and those codes which have followed it: neither gambling debts nor wagers are actionable and gambling losses may not be recovered. On the other hand, with respect to wagers the *Code civil* and the codes of the Latin countries have generally retained the Roman exception in favor of wagers *virtutis causa*, which are, however, generally valid only with respect to the contestants themselves and must not be excessive. The *Code civil* also expressly allows the recovery of gambling losses in cases of cheating. England abrogated the rule of the common law by the Gaming Act of 1845, which made gambling debts and wagers unenforceable. In the United States the same result has been reached either at common law or by statute in many states, although in about half gambling losses may be recovered. In some states the wife or next of kin may also sue; the Italian code contains a similar provision.

A technique of evasion, however, which has met with a large measure of success in the courts, has everywhere tended to nullify the civil gambling restrictions. Loans made for gambling purposes may often be recovered. Negotiable instruments furnish a ready means for evading the law. Valid almost everywhere except in a few American states in the hands of innocent holders for value, a winner can easily collect a gambling debt by negotiating a check or note to another party. Money in the hands of a stakeholder may very generally be recovered so long as it has not actually been paid over. Gambling losses may sometimes be recovered in the case of fraud even in the absence of express provision. The most curious rule of all is one that allows the winner to sue the loser if he has extended the time for payment or refrained from posting him in his club, for such forbearances are held to constitute "new" consideration.

As a problem for the law gambling presents all the usual dilemmas of moral legislation, which always stands a greater chance of success when

it attempts to control rather than to prohibit. All laws that attempt to deal with more than the most marked evils of organized gambling tend to become dead letters. Indeed, when the actual range of police activity is realistically considered, there is probably little difference in the operation of the normal law in most countries.

GAME LAWS are legal limitations upon hunting and fishing. The earliest forms of limitation were the food tabus of primitive societies, some of which practically led to closed seasons on various kinds of game. Other tabus and customary sanctions in some areas curtailed excessive hunting and fishing and others prohibited entirely the killing of certain animals. Herodotus suggests that the elaborate restrictions protecting the sacred animals of Egypt were of a sacerdotal origin.

Another type of game law is the restriction of hunting and fishing rights to a particular group. This is most remarkably exemplified in the forest laws of feudal Europe, by which the privilege of hunting was confined to kings and noblemen. The restrictions were motivated primarily by the theory generally held in military societies that the pursuit of wild animals is a school for war and that only warriors should engage in it. The Persians certainly held this view. Cicero states clearly that "we take the large savage beasts by hunting, partly for food, partly to exercise ourselves in imitation of martial discipline." That feudal principles were recrudescant in the later Roman Empire is evidenced by the law of Commodus making it penal to kill, even in self-defense, the African lion, which was reserved for the imperial hunt.

The forest laws of western Europe are derived, in the opinion of most scholars, from the Frankish royal ban, of which there is evidence at least as early as Charlemagne, on hitherto lordless forests as well as on the woods hypothetically held in common by the so-called mark-fellowships. A fully developed theory of hunting as a royal prerogative was put into effect in the mediaeval empire under the Franconians. In

France this privilege was shared by the great *fideles* of early Capetian times, among them the duke of Normandy, who probably had a well developed forest system in the duchy before William conquered England. The forest laws and administration attained their greatest elaboration in England under the Norman and Angevin dynasties, and because of the opposition they excited in the baronage and community they had an important place in English constitutional history. Henry III's Forest Charter of 1217 is almost as rich a constitutional document as the Great Charter itself.

In England game was classified as of the forest, park, chase and warren. The king reserved the beasts of the forest to himself and derived considerable revenues from the sale of royal game. The afforestation of lands held by subjects, the chief abuse to which the baronage took exception, was designed to encourage the propagation of royal game and to provide sanctuary. It did not destroy the tenant's basic interests in the tenement but placed many restrictions upon their exercise and saddled the afforested region with a system of administrative officials and courts, with powers and principles unknown to the common law. This system declined under the Lancastrians and was used by the early Stuarts merely as a means of raising money by fines. Gradually the privilege of hunting was extended to the landed aristocracy; yet even Blackstone states that the king's prerogative gives him an exclusive hunting right over his whole realm, adding that this is little known or considered.

After the reception of the Roman law on the continent the Roman doctrine that wild animals were *res nullius* was interpreted to mean that "a Sovereign, if he thinks it for the Interest of the Kingdom, may, against the consent of the common People abridge them of the Liberty of Hunting without any Injustice." The ancient forest privileges of royalty had been long alienated to feudatories or allowed to lapse. By the sixteenth century, however, a new royal right of the chase was widely asserted by the continental dynasties, based no longer on feudal but on quasi-Roman law, the law of nations principle. In France even the nobility were allowed to hunt only for the royal pleasure and the notorious system of *capitaineries*, which recalls the rigors of the English forest law, was established. With the decay of feudal society the association between chase and war was replaced by the substituted concept of the chase as sport,

a pursuit marking the moneyed man of leisure but unsuitable for the laboring man as drawing him from his work and encouraging robbery.

When the French Revolution wiped out royal and noble privileges, there went into effect the rule derived from Roman law that game belongs to nobody and that it becomes the property of the one who reduces it to possession, whether on his own land or on that of another. This doctrine was probably imported into the English common law. Legislation in most countries where the civil law has been received has tended to increase and protect the interest of the proprietor in the game within his property, although it has not departed formally from Roman doctrine. The decree of the French National Assembly of 1790 reserved hunting rights to the proprietor while the law of 1844 gave further protection to these rights. An analogous series of statutes was enacted by the English Parliament in the eighteenth century and culminated in the Night and Day Poaching acts (9 George IV, 69; 1 & 2 William IV, 32; 2 & 3 William IV, 68). These proceed on the common law doctrine that there can be no property in wild animals until they have been reduced to possession, but they make trespass criminal if it be for the purpose of killing or taking game. Thus, to all intents and purposes, only an occupier is permitted to exercise his common law right to acquire property in game. These laws were a corollary of tenure by free and common socage, which after 1660 replaced all feudal tenures save those of grand serjeanty and frankalmoign and included a grant of hunting and fishing rights within the tenement. These rights had from Norman times been reserved to the crown and had never been included in the ordinary estate of the subject either in England or on the continent.

Since the leveling principles of the French Revolution permitted a great increase in the number of sportsmen, it became apparent that wild life might soon be entirely extinguished. Furthermore, the financial gain from hunting and fishing, by no means overlooked in the mediaeval English forest administration, added to the danger of this eventuality. The poor rapidly passed from the mere assertion of their right to be sportsmen to the legal and illegal exploitation of game for profit. Wholesale and quite unsportsmanlike methods of taking animals and fish were resorted to and the city markets were flooded with the results of the catch. Even birds not ordinarily considered

game, whose insectivorous habits favored agriculture or whose song or plumage delighted the nature lover, were threatened with extinction. The French law of 1844 initiated the modern movement of enacting legislation designed primarily to prevent the extinction of whole species of living creatures; this was slowly followed throughout Europe and North America. Very primitive precedents can be found for this type of legislation. The Mosaic code provides that female birds shall not be taken when they are hatching their eggs or caring for their young. A curious passage in the *Analekts* indicates that Confucius favored a similar principle. "The Master said: There is the hen-pheasant on the hill bridge. At its season! At its season! Tzū-lu took it and served it up. The Master thrice smelt it and rose."

The general principles of modern game laws vary little in the different jurisdictions of Europe and America. They include a closed season in which the hunting of a given species is forbidden, a limit to the take in the open season, regulation of the sales of game, the absolute protection of non-game birds and of certain species close to extinction and obligatory licenses for hunters, the last chiefly for the purpose of providing revenue for the enforcement of the laws. An international convention was entered into in 1902 for the protection of migratory birds useful to agriculture. In most states of the United States the game law authorities are also empowered to attempt the restocking of forests and waters. In Europe efforts along these lines are generally conducted by private enterprise. Most jurisdictions confer extensive public powers of law enforcement on the representatives of the numerous societies interested in the conservation movement. Soviet Russia confers the right of hunting everywhere within its territories, subject to the usual closed seasons and the reservation of certain sanctuaries and frontier areas.

In western Europe the conservation and reproduction of game and fish belong to the administrative law. In the United States the right of the states to enact laws for these purposes has been challenged on constitutional grounds. Their constitutionality has been maintained upon two grounds. It has been upheld upon the doctrine borrowed from the quasi-Roman principles mentioned above and stated thus: "Wild game within a state belongs to the people in their collective sovereign capacity. It is not the subject of private ownership except in so far as

the people may elect to make it so" [Geer v. Connecticut, 161 U. S. 519, 529 (1896)]. It has also been sustained as a reasonable exercise of the police power "to preserve a food supply," by analogy with decisions upholding pure food laws [New York ex rel. Silz v. Hesterberg, 211 U. S. 31 (1908)]. Many states now include a declaration of the state ownership of game and fish in their legislation.

The arguments presented in favor of preserving wild life through game laws are not completely convincing. So far as its food supply is concerned, the human race could certainly subsist if every wild species including deep sea fish were utterly extinct. The value of birds as destroyers of insects admittedly does not equal that of chemical poisons. The conservation movement of the last hundred years stems not so much from a scientific recognition of man's needs as from romantic humanitarianism. It is probably in part a recrudescence of the primitive human sense of the common destiny of living things; for there is a deep rooted fear that species as well as individuals are subject to death, a fear based perhaps upon a half conscious awareness of the mutual interdependence of all species and of the possibly fatal consequences to the human species if the natural balance is disturbed.

GAMES. See PLAY.

GANGS. The gang is historically significant chiefly as it is associated with frontier conditions or with social or political disorganization. In preliterate groups primary group organization largely precluded the development of gang behavior. In ancient and mediaeval society, however, wherever local or national government had been weak or ineffective there was a tendency toward the formation of aggregations of bandits. Yet these robbing and marauding bands were often organized on a basis of tribal affiliation of blood relationship rather than of common interests economic and otherwise which often bind together groups of diverse membership in modern industrial society. The lack or breakdown of stable agencies of social control in frontier societies, the ease of escape from authority and the lack of settled community life constituted the typical setting of pre-industrial gang activities. As the American frontier, for example, moved westward it was characterized by a great variety of lawless gangs, of which Jesse James and his outlaws were in the public mind the archetype. Australia, Russia, Mexico, China and other areas which were sparsely settled or in process of settlement or which were not readily reached by constituted authority formed a natural habitat for lawless gangs. Before the effective organization of maritime power the pirate group constituted the gang of the sea (see BRIGANDAGE; PIRACY).

Modern life has created a new type of gang whose principal features, best defined in the juvenile stage, are determined by the conditions of life in the modern industrial city. There is, however, a similarity between these and the frontier gangs. A study of the formation of the modern gang reveals that the juvenile gang emerges from play groups and similar aggregations of boys which form most readily in the congested and disorganized portions of the community. It is thus in a sense a frontier product, thriving on the economic, political, cultural and moral borderland of modern life. Since it is so closely correlated with community disorganization it may best be considered a socially interstitial group—one that has its genesis and finds its function in the interstices left by social disorganization.

Although formed spontaneously in response to certain conditions of living the gang is integrated through conflict. It coalesces and acquires solidarity as a result of meeting hostile forces in its local neighborhood or elsewhere. From the standpoint of development three types of gangs

are found, each merging into the other and all three constituting stages through which a single gang may pass. The diffuse type is a loosely knit group in the early stages of integration. The solidified type represents the completion of the process of integration and consequently possesses a high degree of solidarity and morale. The conventionalized gang appears when such a group assumes the external characteristics of a club or some other formal pattern. Certain age types may also be distinguished, although there is much less segregation on the basis of age than has been commonly supposed. Many gangs aspire to become clubs, and most of the groups assume some conventionalized form as their members grow older. Some of these clubs try to be financially independent, but it is easier to be subsidized by politicians or keepers of saloons and speakeasies. Most of them retain their basic gang characteristics even with the more formal type of organization.

It is, however, essential to distinguish between the juvenile or adolescent gangs, which although under the sorry auspices of modern urban slum life must be considered as recreation groups, and the adult criminal groups, whether organized as secret societies (*see* CAMORRA; MAFIA; SECRET SOCIETIES) or for racketeering (*q.v.*). Recent developments in American urban life have given the racket a recognized economic status and have made it a definite part of the political texture of the community, so that it has come to be something more than merely the adult stage of the juvenile gang. The juvenile gang is still important as a "feeder" for the racketeering "mob," and its members are increasingly influenced by the argot and behavior of the elders.

The dominant motive in the life of the gang boy is a desire for new experience or some form of excitement. He finds this in his games and sports and athletics, in patronage of commercialized recreation, in stimulants and gambling and in predatory exploits. He lives in a world of adventure which it is difficult for the unseeing adult to comprehend. His imaginative exploits are often meaningless to the unsympathetic outsider but full of significance for the group itself. Gang activities often take on some of the aspects characteristic of political units in warfare or the struggle for power. Each gang has its local territory which it defends against outsiders, and at the center of this is the "hangout," or territorial headquarters. There is a sort of struggle for existence in gangland which necessitates that every gang shall be on the defensive or offensive

for play privileges, property rights, the physical safety of its members and the maintenance of its status in the neighborhood. These conflicts develop into endless hostilities in some cases, taking the form of deadly feuds among the older beer running gangs. In homogeneous neighborhoods gangs are composed of boys of the same nationality who carry on wars with those of other nationalities, particularly if those nationalities were traditionally hostile in Europe. In heterogeneous neighborhoods, however, there is a rough democracy which enables boys of all nationalities and both the white and Negro races to mingle on a basis of equality. Negro and white gangs are found to be bitter enemies only when they live in adjacent neighborhoods that are unadjusted to each other.

Beyond the territory proper of the gang are usually certain favorite "playgrounds," which include congested and exciting business streets, rivers, canals and water fronts, the "bright lights" areas and the parks. In this area the members of the gang spend most of their time, and here they pick up their effective education. In fact, the physical layout of the city may be regarded as part of a "situation complex" which is an important factor in conditioning and directing the life of the gang; this is particularly illustrated by the relation between the location of the railroad tracks and "junking," an almost universal activity of the gang. Beyond this area lies, even further away, the lure of the unexplored.

The gang in the American city is to be found primarily among the immigrant population. This is in no sense to be attributed to biological factors or to innate dispositions but rather to their economic status and the conditions of living that prevail among them and the cultural dislocation effected by their transplantation. The child of the immigrant tends to escape parental control and become superficially Americanized. The normally directing institutions of family, school, church and recreation break down on the intra-mural frontier of gangland, and the gang is built up as a substitute structure to fill the gap and perform their functions of control. The escape from control seems to apply more to boys than to girls, who except in rare cases when their homes are not functioning do not form gangs. The explanation for this may be in the fact that girls are too well incorporated in the organized life of even the disorganized community to escape control. It may, however, be attributable also to the discrepancy between the traditional

forms in which the impulse to play expresses itself in each sex. The effects of social disorganization are more evident among younger girls in individual delinquency than in gang exploits. It is significant in this connection that among the younger gangs the attitude toward girls is largely hostile, since they interfere with gang activities, but that this does not preclude an extensive interest in sex. Among the older gangs, where the play impulse has given way to a more serious interest in crime, this hostility is largely broken down. Their members frequent dance halls and engage in irregular sex relations, and women often participate in the exploits of the criminal group.

The gang thus becomes the major educational agency and control group in the lives of an appreciable portion of each new generation. It performs this function with a precision usually denied to the accredited institutions. Since it is largely isolated from the life of the dominant and reputable groups of the community it comes into constant contact with but few social patterns that are not disorganizing. Its morality is largely determined in this way. The social patterns for the younger gangs in a neighborhood are set by the older groups and gang clubs, which in turn are influenced by the vice, gambling, crime and general lawlessness with which they are surrounded. Gang boys are subjected largely to the education of the streets and this is reflected in their speech, their songs and verses, their nicknames and the names adopted for their clubs. For an earlier generation the dime novel furnished an imaginative release and a pattern of conduct, but this has been replaced by the moving pictures, chiefly "Westerns" and gangster dramas, which the gang boy finds tremendously absorbing. To achieve the unity and solidarity necessary to the execution of common enterprises the gang, like other groups, uses such mechanisms as punishment, ridicule and applause and also the unreflective controls involved in mutual excitation and rapport, which often lead to the perpetration of foolhardy and lawless acts. The gang code, usually an unreflective structure, may be thought of as its "action pattern" and calls for a distribution of the membership according to importance, with a leader, an inner circle, the rank and file and finally the "fringers," or hangers on.

The extent to which the gang has entered into the texture of modern urban life is indicated by the present writer's study of gangs in Chicago, which disclosed 1313 groups in the city

and its environs, composed for the most part of boys and young men between the ages of ten and twenty-five and including or directly influencing from 25,000 to 35,000 persons. Studies in other American cities have revealed similar conditions prevailing in typically interstitial or gangland areas. Hardly any industrial city in the United States is without gang areas and even the smaller towns and rural communities of the industrial type often exhibit similar phenomena. Similar conditions on a lesser scale exist in the industrial cities of western Europe, although the problem is not so acute in London, Paris and Berlin as in Chicago or New York, largely because of more stable community life, more homogeneous population groupings and better police organization and control.

The problem that the gangs pose lies largely in their connection with crime and political corruption. The younger adolescent gangs are responsible for the bulk of minor delinquencies. The outlook and the habits acquired in gang association encourage truancy, running away from home, rowdyism and ultimately criminality. Almost every influence to which the gang boy is subjected leads toward criminality—including his visits to correctional institutions, which in many cases eventually turn him out a finished criminal. The serious crime of the cities is largely carried on by the older gangs, which include many adolescents in their membership. These gangs are often affiliated with criminal rings and rackets, for which they perform tasks requiring action and "strong arm" work. Behind the gang and the racket stands the politician, and the gang structure facilitates a corrupt alliance between crime and politics. The influence of the politician often begins even with the young adolescent group, with which he ingratiates himself by subsidies of various types. He patronizes the dances and celebrations of the gang clubs, gives them money and secures for them charters and immunity from official interference. In return the gangs get the politician good will, support him on election day and do strong arm work at the polls. If a gangster or racketeer gets into a petty difficulty with the law, the local politician knows how to smooth things over, and in the case of more serious crimes it is often possible for the influential politician effectively to hold up or divert the machinery of criminal prosecution.

The analysis of the gang phenomenon points the way to a method of attacking the problem. Traditional methods of dealing with the gang

boy, as used by the police and the courts, treat him as if he existed in a social vacuum. What is most essential is the attempt to ameliorate some of those conditions of community disorganization, largely incidental to industrialization and urbanization, which characterize the intramural frontier and of which the gang is merely one symptom. Such a process of achieving basic control would take place only gradually and would involve the reorganization of family life, the integration of the immigrant cultures with the American, the lessening of poverty and the rehabilitation of the school, the church and organized recreation. In the meantime the existing gangs and those in process of formation must be recognized and their energies redirected into channels more compatible with the social interest. This has been done successfully in two ways: by making the gang a club and giving it the supervision necessary to make its activities more wholesome and by absorbing it into some larger institution and creating new interests and new loyalties which will have meaning within the larger framework.

GANIVET, ANGEL (1865-98), Spanish author and political theorist. Ganivet studied philosophy, literature and law at the University of Granada and was subsequently Spanish consul at Antwerp, Helsingfors and Riga. His preoccupation with Spain and his love for that country found their expression in his writings, which

exercised a strong intellectual influence upon the literary generation of the early twentieth century. Many of his writings were published in *Defensor de Granada* before appearing in book form. The popularity of his system of thought, which reveals the influence of the stoics and of Nietzsche's philosophy, has, however, recently declined, because of the unfavorable criticism of Ortega y Gasset.

Ganivet's chief theoretical works are *Idearium español* (Granada 1897, 4th ed. Madrid 1920) and *El porvenir de España* (1898; published with *Hombres del norte*, Madrid 1905), in which he attempted to interpret the spirit of the Spanish people and to establish norms for the future development of the country. He saw the origin of Spain's decadence in her conquest of America and in her general policy of imperial expansion. His plea was for a nationalism which would make the homeland the field of its ambitions and which would have as its primary purpose the spiritual regeneration of the Spanish people. He vigorously disapproved of the frivolity of his time, which cloaked itself under pompous rhetoric, thus agreeing with his more profound contemporary Unamuno and with other slightly younger members of the literary generation of 1898, Baroja, Azorin and Valle-Inclan. All of them were keen critics who cleared the air of the false spiritual values which dominated Spain during the period of its colonial disaster.

Ganivet's political ideas contain obvious contradictions. Democrats and those opposed to democracy were able to find in his books arguments in defense of their positions. He was firmly opposed to regionalism, which he regarded as an attempt to create artificial political units. The natural unit, he thought, was the municipality, which should have jurisdiction over all matters except those of a purely national interest.

Ganivet was also the author of autobiographical novels, plays and works on aesthetics and literary criticism. In his *Cartas finlandesas* (1896-97; published Madrid 1905, 3rd ed. 1913) and *Hombres del norte* (Madrid 1905) he introduced to Spain the spirit of the Scandinavian countries and their outstanding literary figures, such as Jonas Lie, Björnson and Ibsen. He possessed a highly personal point of view, but his critical judgments were not always effective.

GANS, EDUARD (1798–1839), German jurist. Gans became the representative of Hegelianism among the German legal historians of his time. He derived from the historical school but transcended its teachings in his systematic conception of law and legal history, in his insistence upon speculation as well as historical research and in his interest in universal legal history. He early involved himself in a controversy with Savigny; his stand took courage, considering the dominance of the historical school at that time. Gans' point of view in Roman law was based on his identification of obligations with rights of action, and hence he recognized the difference between the *actiones stricti juris* and *actiones bonae fidei* as the fundamental ground of distinction in the Roman law of obligations, a distinction which, as he showed in his first book, *Über römisches Obligationenrecht* (Heidelberg 1819), could be made very fruitful in treating its problems. A commentary upon Gaius, *Scholien zum Gaius* (Berlin 1820), also supported his scheme of systematization. In the introduction to his chief work, *Das Erbrecht in weltgeschichtlicher Entwicklung* (4 vols., Berlin 1824–35), he showed how Hegelianism had led him away from the historical school. Gans distinguished legal science from mere legal knowledge and in legal science distinguished between the philosophy and the history of law. In the former the law is considered as it exists without reference to time, in the latter as it necessarily unfolded and developed in time. From this point of view Gans traced the development of the law of inheritance from the Indian, Chinese, Oriental and Greek law to the Roman law and thence to the Romanic, the Anglo-Germanic and the Scandinavian law of the Middle Ages. His recognition of the different determining factors in these bodies of law makes his work a true excursion into comparative law. The lively political sense of Gans was exemplified in his essays on the revision of Prussian law and on foreign political problems.

GANTT, HENRY LAURENCE (1861–1919), American management engineer. Gantt was educated at Johns Hopkins University and

Stevens Institute of Technology and was in the employ of Frederick W. Taylor from 1887 until 1902, when he became an independent consultant. His first and most noteworthy contribution to the technique of scientific management was the task and bonus system of wage payment, generally considered the most satisfactory among differential wage systems of reducing labor costs; its elements are a guaranteed daily wage plus a bonus contingent on achievement of a predetermined output. The second was the "Gantt System" of recording graphically current financial, sales, production and other operating conditions in such a manner as clearly to disclose variations from standards. The third was the spirit in which he devised and utilized this graphical system. Being inclined toward opportunism and more interested in practical improvement than in engineering perfection Gantt gradually minimized the methods of precise measurement and predetermination characteristic of Taylor and Gilbreth, relying on voluntary improvement of operating conditions by management and workers jointly through the educating disclosures of his charts.

GAPON, GEORGIY APOLLONOVICH (1870–1906), Russian priest and labor leader. Gapon was of peasant origin. He studied at the theological seminary in Poltava and later moved to St. Petersburg, where he continued his studies at the theological academy and acted as priest in a poorhouse. His interest in labor and social reform attracted the attention of the Russian police, particularly Zubatov, one of its officials who at that time was active in organizing a monarchist trade union movement to counteract the growing influence of revolutionary socialism. Gapon, a man of ability inspired by a kind of Christian socialism, undertook the task and succeeded in setting up a number of monarchist workers' organizations in St. Petersburg. He was, however, soon captivated by the growing radicalization of the working masses; and when the demonstration organized by his followers on January 9, 1905 (old style), to petition the czar for constitutional reform ended in the slaughter of the demonstrators by military detachments,

Gapon turned against the czar and called for open rebellion. He was forced to flee the country. As an émigré Gapon enjoyed great popularity, but although he continued to be active in the cause of the revolution he never gained the complete confidence of the revolutionary circles. In the autumn of 1905 he returned to Russia but did not participate in the October revolutionary movement. Premier Witte entrusted him with the task of publishing a Russian paper abroad, but the sheet never appeared. Gapon returned again to Russia; in an effort to obtain funds he offered his services to the secret police and undertook to deliver information concerning the activities and leadership of the socialist revolutionaries. He approached Pinkas M. Rutenberg, a prominent leader of their organization, who agreed to supply the information and who arranged for a secret meeting with Gapon. When the latter repeated his request—this time in the presence of several party members hidden in an adjoining room—he was immediately put to death. Gapon left few followers and his organization soon ceased to exercise any influence in the revolutionary movement of Russia.

Moscow 1925); Rutenberg, P. M., *Ubiystvo Gapona* (The assassination of Gapon) (Leningrad 1925).

GARCÍA MORENO, GABRIEL (1821-75), Ecuadorian statesman. García Moreno was educated at the University of Quito, where after postgraduate study in Europe he became a professor of chemistry. His political activities were at first journalistic: he founded several polemical journals, including the *Nación*, and initiated the struggle against the military triumvirate consisting of Generals Urbina, Franco and Robles. He was president of Ecuador from 1861 to 1865 and again from 1869 until his assassination in 1875.

During his presidency, which was in effect a dictatorship, García Moreno tried to apply the doctrines he had advanced as a political agitator. His program may be divided into three phases: reaction, organization and finally consolidation. He founded a civil regime and eliminated the reign of militarism, which had rendered material progress and cultural development impossible. Once order was established, financial reforms were instituted and primary and higher education, especially in the natural sciences, was promoted. At Quito there was built an astronomical

observatory which García Moreno hoped with the cooperation of all civilized countries to make the best in the world. One of his important achievements was the completion of 260 kilometers of the great southern highway.

An ardent Catholic, García Moreno believed the church to be the sole instrument for effecting social and political regeneration and accordingly he wished Catholicism to be the nerve center of the Ecuadorian nation. In 1862 a concordat was concluded with the Holy See by which Catholicism was recognized as the sole religion of Ecuador; it guaranteed the church a number of privileges, including the supervision of education, and allowed ecclesiastical law a wider jurisdiction. The preponderant influence of the church during his rule resulted in the establishment of a virtual theocracy. García Moreno has been one of the most discussed of the Spanish-American rulers; a monster and tyrant to some, he appears to others a hero and martyr.

GARDEN CITIES. What have come to be known as garden cities are new communities developed in accordance with certain principles set forth by Sir Ebenezer Howard (1850-1928) in his book *Tomorrow* (London 1898, 2nd ed. 1902). Howard conceived the idea that the problems of congestion in large cities and depopulation of country districts must be solved together. To accomplish this purpose he advocated the redistribution of industry and population in comparatively small urban units so developed as to provide the combined advantages of town and country life. His proposal was that limited dividend companies be formed to purchase an area of open land of sufficient size to enable the building of a new self-contained town with a belt of agricultural land surrounding it.

It was essential to his project that the town be planned in advance so as to secure adequate facilities for industries and a wholesome environment for the workers' homes; that the town

area be restricted in size so as to prevent its encroaching on the agricultural belt; and finally that the interest on the capital applied to the development of the town be limited to 5 or 6 percent, all profit (above the amount of this interest) derived from the increase in the value of the land and from the public utilities to be reserved for the community. It is obvious that such a scheme could be made successful only as a result of the attraction of a sufficient number of manufacturing plants to the site acquired to provide the means of employment for the desired population.

The term itself was originally used in the United States by A. T. Stewart, who founded Garden City, Long Island, in 1869. While this was to some extent a well planned community providing a partial example of industrial decentralization, it had few features in common with the kind of community visualized by Howard.

At the time Howard's book was published two large manufacturers in England had already demonstrated the feasibility and desirability of the dispersal of industries from crowded centers to open suburban areas and of the building of model villages for their employees. One of these enterprises was carried out by George Cadbury in the Cadbury chocolate works at Bournville, and another by W. H. Lever (afterward Lord Leverhulme) at Port Sunlight.

The publication of *Tomorrow* and the demonstrations given by the Bournville and Port Sunlight experiments led to the organization of the First Garden City, Ltd., in 1903. This company purchased an estate of 3822 acres (which was later increased to 4552 acres) at Letchworth, thirty-four miles north of London. Capital was obtained in ordinary shares and loan stock at fixed dividends of 5 and 6 percent. In 1930 there were in Letchworth about 15,000 people and many manufacturing plants with the services and facilities of a well equipped municipality. The public utilities are owned by the community, and Letchworth is now on a firm financial basis. The plan prepared for the city provided for a population of over 30,000 and for reservation of an agricultural belt of about 3000 acres. The system of tenure is leasehold; leases are granted for ninety-nine years.

The second English garden city was started at Welwyn, Hertfordshire, twenty miles from London, in 1919. It differs from Letchworth in being near enough to the metropolis to invite a considerable "dormitory," or suburban, population but is also to a large extent a self-con-

tained town with its own industries. The population reached about 10,000 in 1931 and is rapidly increasing.

In the United States the new town of Radburn, New Jersey, is being developed on garden city lines by the City Housing Corporation which was responsible for the cooperative garden suburb Sunnyside in Queens, New York City. The site of Radburn is in the borough of Fairlawn, Bergen county, and is only thirteen miles from New York City. Because of the impossibility of obtaining land so near the metropolis at rural prices the estate is not large enough to permit of a permanent rural belt. It is also limited chiefly to persons who work in New York, Patterson and other large cities in the vicinity. But it has been planned in advance and interest on the capital invested has been limited to 6 percent. The outstanding feature of this American example is that the town has been planned for the motor age and is laid out in a series of main highways for traffic with closed end residential streets and pathways to park areas, playgrounds and schools so laid out that children need not cross streets. In some cases this involves the construction of underpasses or bridges between the main blocks.

In the English garden cities the degree of community ownership is strong and individual ownership weak as a result of leasehold tenure of lots; at Radburn the outright sale of the lots with the houses lessens the strength of community ownership.

Many garden villages have been developed by manufacturers for their employees and contain some of the outward features of garden cities. Such villages include Hershey, Pennsylvania, and Bournville and Port Sunlight in England. Most of the so-called garden cities on the continent are in fact industrial villages sponsored by employers, the only single instance of a near approach to a garden city being that of Hellerau in Germany. In suburban districts model neighborhoods known as garden suburbs have been developed at Hampstead, London, at Forest Hills, New York, and elsewhere, but their cost makes them available for middle class and salaried workers rather than for wage earners.

It has been proved that garden cities have several distinct values as object lessons in housing reform and town development. They provide the opportunity of obtaining a healthy social and physical environment by intelligent planning *ab initio*; they assist in decentralizing industry and population and in reducing the

traffic congestion resulting from the distance between homes and places of employment; and they demonstrate the economy and convenience that can result from a well balanced arrangement of functions and building densities. Moreover, they are so organized as to prevent speculative land subdivision with all the waste that it involves. The movement, which is represented by an international association, has influenced the character of development in satellite cities, co-operative housing schemes and in company and government housing enterprises. While the rapidity of growth and the number of garden cities have not fulfilled the expectation of their founders, they have been successful in educating public opinion and in influencing legislation to a much greater extent than was anticipated. Among other things they have demonstrated in England that it is economically unsound to crowd houses on the land in excess of an average of twelve houses to the acre. They have given a new direction to housing reform and promote lower building densities and higher artistic standards in existing city regions. These results have been achieved partly through new legislation giving effect to garden city ideas and partly by the voluntary adoption of these ideas by private developers of urban neighborhoods.

In spite of these social values it is doubtful that garden cities can be built in great numbers in any country. The chief difficulty lies in obtaining the necessary money for financing them. To initiate the building of a garden city it is essential to form a corporation of persons interested, for the purposes of raising capital, acquiring a suitable area of land, attracting manufacturing plants and organizing the development of the town. Another difficulty arises from the fact that garden cities compete with existing cities, which do not want to lose their industries and taxpaying population. Money for their development has to be obtained from private sources and so far much of it has had to be provided on a semiphilanthropic basis. Experience shows that they can be made to pay their way to a moderate extent. They have neither the prospects of high profits nor the dangers of great losses incidental to ordinary commercial enterprises. To make them pay well rapid building is essential, and this involves more available capital than it has been possible to raise in any of the existing experiments. While some government aid has been given to assist garden city housebuilding in England, it will probably always be necessary to rely on private effort and

private finance. While this doubtless means that their number will be limited, as social experiments garden cities will be effective and valuable in proportion as each project is well conceived and well executed rather than in proportion to their increase in numbers.

GARDINER, SAMUEL RAWSON (1829-1902), English historian. Gardiner is recognized as the preeminent authority on the first half of the seventeenth century in England, from the accession of James I to the death of Oliver Cromwell. Although he took a first class in *literae humaniores* at Oxford the fact that he was of the Irvingite persuasion rendered a further academic career at the university impossible in those days when religious tests were still rigid. As the result of prolonged studies in the British Museum and the Public Record Office, supplemented by occasional visits to continental archives, he produced between 1863 and 1901 his great work on the history of England, covering the years from 1603 to 1660.

He took infinite pains in his preparation, learning several languages and reading hundreds of letters of contemporary public men in order to become thoroughly acquainted with their personalities. In dealing with a highly controversial period, treated by previous historians with varying degrees of religious or political bias, he displays a remarkably sober detachment, unprejudiced by royalist or parliamentary

partisanship. For the first time James, Buckingham, Coke, Bacon, Charles, Strafford, Laud and Cromwell are portrayed with discerning knowledge and insight. The account of Bacon's impeachment especially is a model of tolerant and discriminating analysis; James' knowledge and intelligence together with his infirmity of purpose are clearly presented; the "apostasy" of Strafford is put in its true setting; and Cromwell is pictured as a sincere opponent of tyranny in church and state forced by the logic of circumstances to become a dictator. The twofold aspect of the Puritan revolution, political and religious, is for the first time adequately unfolded and the interrelation of foreign and domestic history is patiently and skilfully developed.

While Gardiner's style lacks vividness and color, while he paid little attention to social, economic and literary aspects of his theme, and while some inconsistencies have been pointed out in his estimates of men and policies, his extensive research, his thoroughness and grasp and his sincere effort to tell the truth enabled him to produce a survey of the period which in its political, ecclesiastical and military phases will probably never be superseded.

GARIBALDI, GIUSEPPE (1807-82), Italian patriot. The chivalric heroism of Garibaldi's military exploits and the glamour of his idealistic nature made him appeal to the imagination of the masses more than any other figure of the Italian *Risorgimento*. He was not merely a patriot; his ideal of redeeming his native land was but one aspect of a broad humanitarianism which embraced the ideals of justice, liberty and brotherhood for all peoples. His native impulses first received direction in 1833, when after a youth

passed before the mast on Mediterranean merchant vessels he joined Young Italy and imbibed Mazzini's political doctrines. Plunging enthusiastically into the plots by which Mazzini was attempting to further his twofold purpose of expelling Austrian authority and influence from Italy and of uniting the various Italian states into a single republic, he was condemned to death by Charles Albert of Piedmont in 1834. He escaped and from 1836 until 1848 remained in South America. There he participated in the insurrectionary movements in Brazil and in Uruguay's struggle for independence against Argentina, giving evidence of great military valor. The revolutionary movement of 1848 brought him back to Italy, where in the name of the cause of Italian unification he organized his famous troop of volunteers. The two most important exploits in which he engaged as commander in chief of the volunteers were his brave but unsuccessful defense of the short lived Roman Republic which Mazzini established in 1849 and his victorious expedition to Sicily and Naples in 1860, when with his thousand "red shirts" he overthrew the Bourbon monarchy and made possible the accession of these important states to a united Italy. His participation in the movement of 1860, which culminated in the establishment of the kingdom of Italy under the Piedmontese dynasty, came as the result of a momentous decision made in 1854 upon his return from his second exile after the fall of the Roman Republic. At that time he had separated from Mazzini, the uncompromising republican, and allied himself with the Piedmontese monarchy, which under the leadership of Cavour and Victor Emmanuel had formulated a national liberal policy. Since in the critical period between 1855 and 1861 Garibaldi's example influenced other republicans and great numbers of the masses to join the national monarchical party, his decision was of tremendous significance in the course of the Italian *Risorgimento*. After the expedition of the Thousand his name became a household word; and the hero's glory was enhanced by the modesty and simplicity with which he declined all rewards and withdrew to the remote island of Caprera, there to live the simple life of a farmer while awaiting new opportunities to devote himself to the cause of liberty and democracy. Always the most indomitable champion of the liberation of Rome and the overthrow of the temporal power of the popes, he viewed with great impatience Rome's continued segregation from the kingdom of Italy after 1860; several times he was prevented from

invading the Papal States only by the forceful intervention of the Italian government. He followed the vicissitudes of the American secessionist struggle with intense interest and for a while meditated organizing a force to assist the South. In 1870 he went to France to fight for the republic against Prussia. In the midst of his warrior's career he never forgot that the supreme ideal of humanity is peace founded upon justice, and he offered his name and eloquence in support of the pacifist movement. After the liberation of Rome was finally accomplished in 1870 he dedicated his last years to improving the condition of the masses, openly sympathizing with socialism, which to him seemed a movement of social redemption. His death was mourned by democracy throughout the world.

GARMENT INDUSTRIES. The garment industries as treated here will be restricted to the "needle trades"; that is, the manufacture of men's, women's and children's wearing apparel, both ready and custom made, together with their auxiliary groupings. The organization and importance of the manufacture of clothing for sale have always been largely influenced by the characteristics and extent of the market. In the Middle Ages the market was of course not only local but small. Such clothing as was produced outside the home was made to order by the guilds of women dressmakers and tailors. The poorer classes were supplied by the second hand clothing dealers, organized in a separate guild, for the sale of new ready made clothing was forbidden except during the merchants' and tailors' fairs. Moreover, as in other industries of the period, production was rigidly controlled. Both the guilds and the municipal authorities carefully regulated the quality and price of the

garments, and their control over the industry extended even to regulation and guaranty of the wages of the journeymen.

For many decades after the breakdown of the guild system the lack of a market caused the clothing trades to remain relatively insignificant. Even when homespun was replaced by the products of the textile mill and fabrics declined in price, the industry expanded but little. In the eighteenth and the early nineteenth century clothing was not produced in factories employing large groups of workers despite the rapid spread of this system throughout other industries. Traveling tailors and small custom order shops supplied the well to do; shirts and underwear were made at home until the middle of the nineteenth century; in agricultural sections the farmers' wives made all garments. The industry's rapid development during the latter part of the nineteenth century was a phase of the industrialization of handicrafts; it was contemporaneous, whether as cause or effect, with the increasing tendency for families to adopt the method of purchase in place of home manufacture for supplying the needs of daily life. The requirements of the working classes indeed had already brought about a considerable traffic in second hand clothing, and establishments for renovating and distributing such clothing had existed in all parts of Europe in the eighteenth century. Another factor leading to the fabrication of ready made clothing was the desire of the custom tailors to produce for an outside market during the periods of seasonal lull; this resulted in the commercial development of the clothing trades on the small shop and home work basis long before production was organized in the large factory. In Germany the same tendency was to be seen; in the early eighteenth century the master tailors had statutes passed which permitted them to keep ready made clothes in stock—an effort to ameliorate the effects on the custom trade of the depression of the period. The mass market, however, was still only potential; the wages of factory workers did not yet permit the spending of much money on clothing, especially as prices were comparatively high.

But the existence of a potential market led to modernization within the industry, facilitated by a series of technical inventions of which the earliest and most important was the invention of the sewing machine in 1846. Steam power was used as early as 1865 in England. Thereafter, beginning about in the seventies, the introduc-

tion of the standard pattern and of the button sewing, buttonhole and pressing machines were rapid stages in the mechanization of clothing production. By the middle of the nineteenth century the manufacture of clothing showed signs of developing from a small home industry producing for a local and restricted market into a modern factory industry with its division of labor, a standardized product and a swiftly expanding market. The development of transportation facilities, urbanization and higher standards of living contributed along with inventions to the growth of the market, as did the social acceptance of uniform and standard goods which accompanied general industrialization.

In England the expansion was rapid after the invention of the sewing machine, and by 1890 wholesale tailoring was well established. At present the industry employs over half a million workers, three fourths of whom are women. The handicraft tailors number only 20,000 and are rapidly giving place to the large manufacturer of high class custom and ready made garments. The village tailor and dressmaker, who never supplied a product of high quality, have been driven out by the growth of wholesale production of cheap ready made and, recently, custom made clothes. Many firms making ready made clothes have developed their own retail stores, as in the United States, while retail tailors now increasingly maintain their own manufacturing, or "inside," shops. The handicraft tailors, one quarter of whom are concentrated in the West End of London, are now chiefly occupied in the making of men's suits, riding breeches and uniforms. All other branches of the trade, including even overcoats and ladies' outer garments, are rapidly being absorbed into the factory industry. Although there has been a marked increase in the use of machinery in the past fifteen years, there is less standardization of process in both the wholesale and retail custom trades than in the United States. Competition remains the dominant factor, but there have been large amalgamations since the World War among the big stores retailing clothing.

The development of the clothing trade in France was similar to that in England, yet France remains today the outstanding example of the custom industry, chiefly because of the leadership of Paris as the international buyers' market for women's clothing. The development of large scale factory production has been checked by the persistence of home work, which exists for the same reason that the subcontracting system is

found in England and the United States—it affords a cheap labor supply and is easily adjustable to market and seasonal requirements, and the cheapness of the sewing machine makes large and concentrated investment of capital unnecessary. Home work is most widely extended in the making of women's wear; in this trade it produces the cheapest and the best garments, while the factories turn out the medium priced garments. A possible explanation of the prevalence of home work and handwork is the encouragement by both government and unions of the establishment of trade schools, which turn out highly skilled workers in the tradition of luxury production pervading most industries of France. The production of ready made garments has gone farthest in the manufacture of underwear, women's cloaks and blouses and men's clothing. The last named branch of the industry is relatively concentrated; the making of women's ready made outer garments is scattered in many small firms, whose volume of business amounts to only several million francs a year. But since the *couturiers* may employ from 100 to 1000 workers and the large department stores also sell custom made clothes, the custom trade and small scale industry are not necessarily synonymous in France. In general there has been an increase in the number of large and small houses since 1901 to the exclusion of the medium sized firm. In 1921 the clothing workers numbered 1,215,000, of which 289,000 were in Paris and its environs. There has been a tendency for the numbers employed in the trades to decrease, particularly in the women's custom branch, which is at present still the largest, employing over 500,000 workers. The production of ready made clothing, however, has been expanding; the number of workers employed increased from 91,000 in 1906 to 104,000 in 1921, and the spread of industrialization is also indicated by the exodus from Paris to the provinces. Nevertheless, the clothing industries still provide the best case of widespread home work and handwork, especially by women, with their accompaniment of low output per worker.

In Germany factory production is driving out the custom tailors, although to a less extent than in England. A few years before the war the industry lost its foreign markets as the manufacture of clothing in other countries increased, and since that time it has manufactured almost exclusively for a domestic market; the ready made branch now supplies from two thirds to three quarters of the working and middle classes

with clothes. The industry as a whole, including all types of wearing apparel, had an output of 4,500,000,000 marks in 1927 and engaged 1,427,657 employees in a total of almost 600,000 firms; the garment trades, with the exception of knit goods and hosiery, employed almost one million workers in 397,596 establishments. In the cities, particularly in the men's garment industry, contractors generally give out jobs to workers, who sew at home on the various parts of the garments. In the rural districts direct manufacture for sale to retailers is more prevalent. The organization of the industry is characterized by the small workshop of less than six persons: 58 percent of all the persons engaged in the industry were attached to such shops in 1927; but, on the other hand, the percentage of employees in firms employing over 50 workers increased from 2.62 in 1882 to 20.7 in 1925, and in the underwear trade over 50 percent of the workers are attached to large factories. Thirty percent of all production is still turned out by hand, but factory production is spreading and the number of corporations has increased from 19, with a capital of 39,600,000 marks in 1913, to 312, with a capital of 116,000,000 marks in 1926. Industrial concentration, under the influence of post-war rationalization, has been steadily increasing. There is less geographical concentration than in the United States, but 80 percent of all women's wear is manufactured in Berlin and one firm has practically a monopoly of men's cheap ready made and work clothes.

Nowhere has the growth of factory production been so rapid or so widespread as in the United States. Until the Civil War women's cloaks were largely imported from France, and afterward French tailoresses were employed by American business men to design women's garments and supervise their manufacture in small shops, often attached to retail stores. The most effective fillip to the industry was given by the Civil War, when the clothing requirements of the army led to the establishment of large shops for the manufacture of uniforms in New York City and to the necessity for substantial imports from Prague and Vienna. From 1889 to 1899 the growth of the garment industry in the United States by number of workers and value of product was two or three times as rapid as the average for all industries. This growth continued, at a slower pace, until 1910; since then it has declined, indicating that by that date the making of garments had become completely separated from the home. Since 1910 the industry has taken its place with

other industries, manifesting a normal growth.

By 1930 the United States had come to occupy a preeminent position in the manufacture of all articles of clothing. Only in Soviet Russia and to a certain extent in Germany was there a comparable development of the mechanized clothing factory during the ten years after 1920. The total of all garment industries, excluding leather shoes, in 1929 employed more than 750,000 workers, whose combined value of output was close to \$5,000,000,000. Among the many branches of the industry the manufacture of women's clothing, including suits, dresses, coats, shirt waists and underwear, is the largest, with a total output of nearly \$1,500,000,000; it is closely followed by the men's clothing industry, which in 1929 produced men's and boys' outer garments to the value of \$756,000,000. The remaining half of the output of this group of the garment industries is distributed over the manufacture of shirts, men's and women's hats, furnishings, millinery and lace goods, fur and knit goods and minor articles of clothing.

It is characteristic of the expansion of this industry that the production of auxiliary items, originally of little significance, has become with the rise in the standard of living and with the increasing influence of fashion of first importance. Thus the men's furnishings industry, not including shirts and collars, now employs more than 25,000 workers and the value of its output is close to \$150,000,000. The knit goods and hosiery industry likewise has grown to such proportions that in 1929 it employed 208,397 persons, or more than the men's clothing industry, and had a total output of \$899,717,000. The influence of the march of industrialization is, however, best indicated by the changing position of the women's clothing industry during the past forty years. While in 1899 the value of output of the women's garment industry constituted only 39 percent of the combined value of the men's clothing, women's clothing and shirt industries, by 1929 it represented 59 percent of the value of output of this category.

The history of the development of the hosiery industry has been quite different from that of other branches of clothing manufacture. The large scale production of hosiery by machine methods was inaugurated very early, and neither the method of manufacture nor the product itself shows the characteristics which make the needle trades unique. Originally stockings were made of cloth, then knit by hand; toward the end of the sixteenth century the invention of the square

stocking loom by William Lee in England introduced hosiery production on a larger scale. Later the spinning jenny, the application of power to knitting frames in 1832, which reduced the cost of manufacture to one tenth of what it had been, and the circular knitting machine, invented in 1851, gave new impetus to the industry; but on the whole its growth was slow in the nineteenth century, in part because of difficulties in perfecting the machinery. The most striking development occurred in the Civil War period, when the government was buying large supplies of hosiery. From that time on the production of hosiery by machine in the United States has been rapidly increasing. The types of hosiery produced, however, have changed radically, particularly during and after the World War. From 1914 to 1923 the production of cotton hose decreased by 6.17 percent, while over the same years there was an increase of 26.77 percent in the output of silk hosiery and of about 417 percent in that of hosiery made of rayon and mixed fibers. Among the influences which account for the expansion of the silk and rayon hosiery industry are the shorter skirts and the thinner and lighter colored stockings worn by women in recent years. The output of the seamless variety of hose has remained practically stationary since 1919, although about 95 percent of men's hose are of this style. Full fashioned cotton hosiery, manufactured chiefly for women, has declined in importance also; but the yearly production of the full fashioned style as a whole, including silk and its imitations, increased over 250 percent from 1919 to 1928 and in 1930 reached 25,000,000 dozen pairs, slightly more than the output of seamless hose. Continued increase in the per capita consumption of full fashioned silk hosiery is, however, doubtful, since style changes in dresses and the use of mending service for stockings discourage the purchase of many pairs of hosiery.

Since 1923 there has been an overexpansion of the full fashioned hosiery industry; the mills, which often begin their operations on a large scale, increased in number from 92 in 1919 to 263 in 1929, although in 1928 there was a drop of 8 percent in the output of one half the mills. As the machinery used is both complicated and expensive and not readily adjustable to changes in output and style, the financial burden on the manufacturers has become heavier. Export markets have been a negligible factor; foreign consumers lack the income to buy such a luxury article, and only about 3 percent of the total

output of full fashioned hosiery was exported in 1929. On the other hand, foreign competition has been slight, with imports restricted to the cheaper cotton hose and to fancy styles made on a small scale. Efforts to avoid the consequences of overexpansion have been made along two lines: there has been a movement toward the south, where wage scales are about one half as high as in the northern states; and there have been widespread attempts to decrease overhead charges by running the mills on double shifts and using the multiple machine system whereby one worker tends several machines. The industry is still largely localized; thus the Philadelphia and Reading areas account for 62 percent of the machinery used, and 10 percent of the mills are in New Jersey. But the most rapidly growing area is the south, where 15.6 percent of the mills were located in 1929.

The hosiery workers are organized in the American Federation of Full-fashioned Hosiery Workers, affiliated with the American Federation of Labor. Of a total of 113,000 workers in the industry 15,000 are organized in the full fashioned branch. In the past few years the union has also attempted to penetrate the south. The average wage for "leggers" and "footers," who are highly skilled operators, ranges from \$60 to \$75 a week in the north and around \$34 in the south. Other workers in the trade receive much lower rates—from \$13 to \$27 a week, depending on locality and unionization as well as on the type of work performed. The union has opposed the double shift except as a temporary emergency measure and is particularly antagonistic toward the multiple machine system. The hours worked vary widely according to the task and to economic conditions, but the union is making efforts to introduce the forty-four hour week.

In structure and business organization the garment industries are marked by peculiar features. In the early stages of the industry the wholesale distributor of clothes rarely ran his own factory but farmed out the materials to contractors, who had the garments made either in the homes of workers or in small shops. Thus the term manufacturer, generally used to describe the wholesale distributor or the retailer, is not really descriptive of his function except where he maintains an "inside" shop, doing at least part of his own manufacturing. The "outside" shop, or contracting system, began in the United States in the eighties; it was fostered by the small, cheap sewing machine, which could

GROWTH OF AMERICAN GARMENT INDUSTRIES, 1889-1927

YEAR	NUMBER OF ESTABLISHMENTS	NUMBER OF WAGE EARNERS	VALUE ADDED BY MANUFACTURE (IN \$1000)	VALUE OF OUTPUT (IN \$1000)

* Men's clothing includes men's and boys' outer wear, work clothing, parts of men's outer clothing made in separate establishments, buttonholes for both men's and women's outer garments, shirts. Women's clothing includes women's and girls' outer clothing and women's cloth underwear. Fur goods include men's, women's and children's outer garments, sets, trimmings, hats, caps and gloves of fur. Knit goods and hosiery include all knit goods, both under and outer wear. Hats and caps include felt, straw, cloth and, except as noted, wool hats and caps. Miscellaneous items for 1889 include the following census classifications: custom millinery (30 percent of total by value of output), artificial flowers and feathers, buttons, corsets, men's furnishings (i.e. neckwear, belts, handkerchiefs, bath robes, pajamas, cloth underwear, etc.), gloves and mittens, millinery and lace goods (untrimmed hats appear partly under hats and caps). For 1899: custom millinery (37 percent of total by value of output), artificial flowers and feathers, buttons, corsets, men's furnishings, men's collars and cuffs, gloves and mittens, millinery and lace goods. For 1909: artificial flowers, feathers, buttons, corsets, men's furnishings, men's collars and cuffs, leather gloves and mittens, millinery and lace goods. For 1910: artificial flowers, feathers, buttons, corsets, men's furnishings, men's collars and cuffs, leather gloves and mittens, cloth gloves and mittens. For 1920: artificial flowers, including preserved flowers and plants, feathers, buttons, corsets and allied products (i.e. brassières, corset covers and like goods), leather and cloth gloves and mittens, men's furnishings, millinery. In spite of apparent similarities in name the classifications under miscellaneous for the various years are not comparable, as changes in the composition of the items were made throughout this period. Figures on the industry as a whole are not strictly comparable because prior to 1890 census statistics apply to factories, hand and neighborhood industries; figures for 1899, 1909 and 1919 relate to factories, generally those using some machine process, whose products are valued at \$500 or more; and 1929 census statistics relate only to establishments whose products are valued at \$5000 or over. Figures for 1929 are preliminary except for knit goods and hosiery, which are revised figures.

† Dressmaking not listed separately.

‡ Hand knit industry does not appear separately.

** Not including wool hats, which were included with woolen, worsted and felt goods in 1899 and 1909.

be easily installed in tenement houses, and by the freedom afforded to the manufacturer, who was relieved of responsibility for managing a factory and could give his entire attention to the expanding market. In 1890 the successful struggle for union recognition and better working conditions encouraged the growth of inside shops, since the advantages of cheap labor under the contracting system were thus lost. Friction resulting between the contractors and workers led the former to become small manufacturers, driving out the large distributors; and for a time the contracting system declined. From 1900 to 1910 these small manufacturers began to expand their operations and to adopt the contracting system again. But when higher wage rates were established in these new contracting shops, the manufacturers tried to escape the high labor costs by becoming jobbers; and a new type of relationship was developed, that of manufacturer-jobber-submanufacturer. The jobber is a middleman who does not employ workers or accept any of a manufacturer's functions. He buys from the true manufacturer—the subcontractor or submanufacturer—and sells to the wholesaler or retail merchant, called the “manufacturer.” The jobbing system grew rapidly from 1916 to 1919, both because of labor pressure and because the jobber's offer of “immediate delivery” made it unnecessary for the manufacturer to maintain a large stock and risk loss due to the high prices of materials during the war.

At present the importance of these three types of organization—inside shop, contracting and submanufacturing—varies in the several branches of the industry. No data on the relative importance of the three systems exists; but in New York City, which in 1924 supplied about 80 percent of the national production, three quarters of the dress and cloak business is carried on under the submanufacturing system. Chicago and Rochester, on the other hand, are characterized by inside shops. There is practically no submanufacturing in the underwear and children's wear trades and relatively little contracting. But in the dress and cloak and suit trades all three forms of organization are found and frequently overlap. Characteristic features of the industry continue to make the submanufacturing type of organization attractive and account for the recurring competition between the two main types of business organization—the manufacturer who follows the modern tendency toward large scale factory production by buying his own materials, manufacturing in his

own plant and selling his own finished product to the retailer and the manufacturer who is pre-eminently a merchant and has his manufacturing done outside. Probably the most important factor responsible for the persistence of an archaic method of production is the low capital requirement of the industry. In spite of the progress in mechanization it is still possible for persons with a small capital to start in business and compete on favorable terms with large producers. Many of the advantages which large scale operation derives from the use of machinery and division of labor (large shops show in their specifications more than 200 distinct operations on the coat alone) are more than balanced by the low overhead, elasticity in business policy and the opportunity to use the cheap labor supplied by the submanufacturers.

Fashion changes are a second factor leading to the persistence of the small shop. The ability to alter rapidly the organization and stock of a small shop creates a competitive advantage not easy to overcome by superiority in manufacturing facilities. External conditions are often favorable to the submanufacturing system; thus during the past few decades many large inside factories were built up in the men's clothing industry in response to the demand for a uniform product, which can be provided only with difficulty under the conditions of management prevailing in the contract shop. But under the adverse conditions of the last ten years, culminating in the depression of 1930-31, the steady downward movement in retail prices and the drop in volume of business to about one half its former figure turned even many of the large buyers again to the small producer. Accordingly in the men's clothing industry the average number of workers per establishment, which increased from twenty-four in 1899 to forty-seven in 1927, declined to forty-six in 1929 and has probably suffered a further substantial decline since then. In the women's clothing industry the trend in the size of shops has been downward since 1905, when the number of employees per establishment was 34.5. By 1929 this number had declined to 23 and it is not unlikely that the average establishment has become much smaller in the past two years. On the other hand, the average shirt factory, with a relatively standardized product, has always been larger than the men's or women's clothing plant; it reached its greatest size, 68 employees per establishment, in 1929.

New supplies of immigrant labor and the movement of manufacturers to small American

towns have also contributed toward the instability of the industry and the periodic rise of the small shop. Particularly after 1880 the successive waves of immigration of Jews, other eastern Europeans and Italians, all more accustomed to employment in small handwork shops than in factories, made available to the small enterprisers in the garment industries large supplies of low priced competing labor. This process was in full swing until the eve of the World War and was responsible for the existence of a great labor surplus in practically all branches of the industry. Only during several of the war years and the inflation period of 1919-20 was there anything like a full utilization of the available labor. After 1920 the restrictions on immigration; the further employment of women as the work became less skilled; the displacement of labor by machinery; and the entrance into the industry of many native born, attracted by high wages, improved working conditions and the "open door" policy of the unions, again created a serious labor surplus and aggravated the already strong tendency toward severe competition and falling prices. During depression periods the practise of sending work like hand finishing and buttonhole making to the homes is also revived.

Removal from cities for the purpose of exploiting new supplies of labor likewise grows in frequency under the influence of depression and price cutting. Historically the centers of the industry have shifted much after the manner of the great changes in the localization of industry that have occurred in the cotton textile industry. Thus Boston, which was formerly one of the largest men's clothing centers in the country, now occupies only a minor position; Cleveland's importance in the industry, on the other hand, began to grow in 1925 almost entirely because of the rise of one firm. Cincinnati has had somewhat the same experience. In its latest phase, starting with the depression of 1921, the tendency has been toward decentralization. Especially for the production of garments whose manufacture is relatively simple shops have been organized in districts which constitute the hinterland of metropolitan centers in New Jersey, Connecticut, Pennsylvania, Michigan and Illinois, and in some sections of the south such shops now constitute a fairly considerable industry. Started with a nucleus of skilled labor from the cities, these shops give employment to rural labor, as in the agricultural sections of Wisconsin, or to the women members of impoverished wage earners' families, as in the mining towns of Pennsylvania.

Only tradition, the assistance of a supply of experienced labor and proximity to consuming markets can retard this movement from cities, which is accelerated in bad and checked in good times. High quality products are still made almost exclusively in the established centers. New York City has remained the primary center for the manufacture of both men's and women's clothing. It has had the benefit of a large supply of the most skilled and experienced tailors. Close to the largest retailing establishments in the country and consequently sensitive to the swift changes in taste and fashion, it has been able to serve the demands of important buyers throughout the country. The New York industry under the jobber system has also acquired the characteristics of a spot market for both expensive and cheap garments, quick to open its shops and quick to shut down. The effects of powerful forces of competition, however, have been felt even in New York and its output in relation to that of the country as a whole has shrunk since the close of the war.

In an industry thus organized it is inevitable that bankruptcies and waste should be prevalent. It has been estimated that one third of the New York submanufacturers go out of business annually. The work processes and appliances are not standardized in large sections of the trade; much work is done according to traditional methods rather than in any "one best way." Moreover, it is questionable whether the seasonality of the industry is entirely due to whims of the consumer. With such a high degree of competition the retailer is afraid to guess as to future styles and also demands many small and unimportant style changes which cause the direct labor per garment to be far too large. In a study made in 1921 it was discovered that the retailer was accustomed to order in minute lots—as few as three suits, for example. At the same time tests made in three large retail establishments showed that the customer does not require much variety; in one case 11 out of 31 suit models accounted for 78.25 percent of the sales; in a second, 9 out of 22 models accounted for 94 percent of the sales; and in a third, 11 out of 43 models accounted for 94 percent.

The custom trade in the United States, which is now largely confined to the more expensive items of clothing and probably employs less than fifteen thousand workers, has had to meet competition from three sources: the ready made trade, the "special order" factories doing custom work of a rather cheap grade and the "team"

system in factories, a result of the efficiency movement. The relative unattractiveness and difficulty of the work have led to a decline in the number of apprentices, as in Great Britain; and the custom industry maintains itself chiefly in New York City, although even there it is of decreasing importance.

The rapid expansion of the market in the nineteenth century led to extreme competition, and the technical possibility of small scale manufacturing retarded factory organization; hence it is not surprising that working conditions and wages were ill regulated. Security of the job was unknown throughout the industry. Wages were extremely low, and through the practise of employing apprentices and learners a substantial portion of the workers would receive for a time either no pay at all or only a few dollars per week. In addition the workers were quite generally required to buy or rent their machines, supply their own tools and pay a variety of fines, which frequently exhausted their meager earnings. By the terms of the task system, whereby an employee would receive his fixed weekly wage only upon the completion of a specified quota of work, the majority of the clothing workers were required to work seven days a week, and in the busy seasons custom tailors frequently worked as long as twenty hours a day.

By the last decade of the nineteenth century public attention was focused particularly on the sweatshop evils in the manufacture of clothing. The Australian Factory and Workshops Act of 1896 and the New Zealand Compulsory Arbitration Act of 1894 marked the establishment of minimum wage machinery which applied to the clothing trade as well as to other sweated trades. In England agitation over the low wages, irregular employment, long hours and unsanitary conditions of the garment trades began in the eighties with the spread of the outworker system. In 1909 the first Trade Boards Act was passed, establishing control over industries where unusually low wages prevailed, and a board for the wholesale tailoring industry was the first to be set up. After 1918, when the jurisdiction of the trade boards was extended to industries without effective machinery for collective bargaining, all branches of the garment trades came under trade board control and a marked improvement in wages and factory conditions and a decline in the number of home workers resulted. The Aliens Immigration Restriction Act of 1911 produced a shortage of labor which also contributed to the rise in wage rates and the extension of

mechanized factory work. Working conditions in the handicraft and outworkers' divisions of the industry, however, are still far from satisfactory. Unionization has progressed slowly; in 1928 only 10 percent of the insured workers in the clothing trades were unionized. The two leading unions in the men's trade are the Amalgamated Society of Tailors and Tailoresses, a conservative craft union which numbered in 1926 only 13,000 members, and the Tailors' and Garment Workers' Trade Union, whose policy has been influenced by Communist leaders and which has amalgamated with many of the small unions, reaching a membership in 1926 of about 50,000. The custom tailors, whose strongest nucleus of organization is in the West End of London, have recently arranged to join the Amalgamated Society, and a larger group of garment workers is affiliated with the Shop Assistants' Union and the National Union of General Workers. The women's dress and cloak industry is marked by weak unionization and lower wages than those prevalent in the men's trade; so too is the shirt, collar and pajama branch of the industry, which has lost in large measure its formerly active export trade. Employers' associations exist in the men's retail and wholesale trades but are weakly organized in other branches of the industry. They are interested less in relations with the unions than in production and market problems; the Master Tailors' Association, composed of Jewish subcontractors, is the only group primarily concerned with wages and prices.

The most rapid improvement in the working conditions of the French garment employees has occurred since the World War, although by 1906 inspection of health and safety conditions had been established for both factory and home work, and by 1914 night work had been completely suppressed. In 1915 the Homework Act established a minimum wage for home work by women in ready made clothing and its auxiliaries; and at the present time similar provisions are made for men. A placement service has also been functioning since 1915. In general, however, the widespread existence of home work and small shops in France has made the industry not only difficult to control from the social point of view but also difficult to unionize. The *Fédération des Ouvriers de l'Habillement*, affiliated with the *Confédération Générale du Travail*, had 26,000 members in 1919 and the "free syndicates," which represent conservative employees' groups, claimed 18,000 members; nevertheless,

the great majority of the French garment workers are outside the unions. The handicraft workers, with their low incomes and irregular employment, are difficult to organize and in France the unions have not only encouraged the custom trade by supporting trade schools but have preserved a prejudice against woman members which has militated against effective unionization of the women's clothing trade in particular. There are no national employers' organizations, and the employers have consistently opposed union recognition. But some gains have been made for the garment workers through the activities of the unions. Since 1919 the Parisian workers on men's and women's clothing have had the forty-eight-hour week, and since the war there have been rapid increases in wages following successful strikes. The free syndicates have also organized the home workers to some extent, although at the same time the *Fédération des Ouvriers de l'Habillement* has been voicing opposition to home work. After the war the syndicates were the activating force in the establishment of family allowances, widows' pensions and other measures which protected the woman garment worker.

In Germany the clothing factories have been subject to inspection as to sanitary conditions and safety since 1901, and as elsewhere the attempts to evade the factory laws have encouraged the persistence of home work. An attempt to stamp out home work was made after the war, and the Home Work Act of 1923 created trade committees to give advice on wages, hours and sanitary conditions with the expectation that the committees would make use of collective agreements as far as possible; but since these are not adequate there is still no satisfactory arrangement for fixing wages for home work. Where collective agreements with the employers' associations exist, piece rates are general (with the exception of the ladies' tailoring trade) and the ten-hour day has been won. The German clothing trade, over half of whose workers are women, is at present the only industry in which women receive the same wages as men; and it can be said that where unionization exists the women are organized in proportion to their participation in the occupation. In 1927 the union membership reached a total of 95,000, but the persistence of small shops and home work makes the German clothing industries among the more difficult to organize.

In the United States there has been little protection of the garment worker by public regu-

lation. In so far as the public was concerned with the plight of the clothing worker it engaged in agitation against the unsanitary conditions prevailing in the contract shops and homes of the tenement house workers, hoping to create effective demand for the reform and control of the industry by arousing the fear of the consumer. On the other hand, the extent and achievements of unionization in the United States are striking. For generations the garment industries have been the scene of an uninterrupted struggle for the organization of a labor movement. The first signs of permanent organization appeared in the eighties under the contagious influence of the Knights of Labor. By the beginning of the next decade the United Garment Workers and the United Hatters had been organized in the men's clothing, fur and felt hat industries. By the use of the union label the United Garment Workers gradually gained control over the shops producing work clothing. By vigorous campaigns of boycotting the hatters' union penetrated the large factories of the country until 1915, when it was dealt a blow from which it has not yet recovered, by the decision of the United States Supreme Court in the famous Danbury Hatters' Case that its boycotts were illegal under the Sherman Act and that individual union members were financially liable for damages and costs resulting from the boycotts.

The most familiar unions in the garment industries, however, had a different origin and pursued a novel course. Their foundations were built by young immigrants from Europe, particularly from Russia and Poland, who settled in the metropolitan cities of America from the eighties onward. These men and women, impregnated with the doctrines of revolutionary socialism, began the organization of the machinery of mass education and solidarity which is essential to the creation of mass movements. The earliest of these was the fraternal and beneficial organization of Jewish working men, the United Hebrew Trades, which throughout the following decades became the source of propagation of labor ideas and organization campaigns. A Yiddish daily newspaper, the *Forward*, was founded in 1897 and wielded a powerful influence in the rise of many of the unions in the needle trades.

The earliest of the great national organizations in the clothing industries was the International Ladies' Garment Workers' Union organized in 1900. For the first decade it struggled, like its predecessors, for mere existence. After tremendous strikes in the dress, waist and cloak indus-

tries of New York City, however, a Protocol of Peace was signed in September, 1910, and the union was established. In the remaining years of the decade the union spread rapidly to Chicago, Boston and Cleveland, to the principal centers of Canada and to the other branches of the industry. By 1920 it had achieved substantial control over the industry; its membership, however, has since been cut from 105,400 in 1920 to 32,300 in 1929 as a result of business conditions in the trade and factional struggles within the union. Composed of the same classes of workers living in much the same communities, the strong national unions of the cap makers and the furriers likewise rose to power in this period; the former union was practically 100 percent organized in 1930 and the latter in spite of depression in the trade and factional splits included about 80 percent of the fur workers.

The uprisings in the women's clothing industry were not without repercussions in the other needle trades. The periodic strikes called and managed by the United Garment Workers did not bring permanent organization in the men's clothing shops. But in 1910 a city wide strike broke out in Chicago. A bitter fight lasting for many months soon settled down into a struggle between Hart, Schaffner and Marx, the largest clothing manufacturing company in the country, and its employees. In 1911 the strike ended with an agreement recognizing the union and establishing a scheme of arbitration of future disputes. This settlement marked the beginning not only of a campaign to organize the whole of the men's clothing industry but also of the conflict between the Jewish, Italian and eastern European immigrant membership of that organization and its native leaders. The revolting groups, who were refused seats at the Garment Workers' convention in 1914 and whose request for recognition was denied by the American Federation of Labor, formed early in 1915 the independent union known as the Amalgamated Clothing Workers. Within four years the Amalgamated, assisted partly by the favorable economic conditions arising out of the war, had organized the majority of the leading clothing factories of the country and had established local organizations throughout the United States and Canada, reaching a membership of about 150,000 in 1927. The United Garment Workers, which was reduced to 47,500 members in 1930, retained jurisdiction over employees in work clothing and raincoat factories, where ownership of the union label constitutes its chief source of strength. In the

Journeyman Tailors' Union, whose membership has been cut in half since 1920 because of competition from other branches of the industry and the economic depression, the question of merging with the Amalgamated has frequently arisen. The membership of the Communist Needle Trade Workers' Industrial Union is difficult to estimate; during the factional struggles of which it was a product it drew many members from the International Ladies' Garment Workers' and Fur Workers' unions.

With the advent of the unions recruited from the new immigration the period of struggle for the right to organize was largely ended, and the industry and its organized workers entered the phase of constructive experiments in industrial control. The "new unionism" developed, representing a sharp divergence from the prevailing policies and practises of the typical American labor organization. Aims were not defined as "a fair day's work for a fair wage," but involved plans for the fundamental reorganization of the industry, many of which have on occasion been put into practise. In the choice of weapons for the advance of the labor movement the needle trades' unions have not hesitated to join the ranks of radical political parties, from the Socialist and Communist parties to the Conference for Progressive Political Action in 1924. By opening their doors, with rare exceptions, to all applicants for membership regardless of skill, race, color or sex they have challenged the old belief that women, workers of diverse nationalities and those of different crafts cannot be permanently organized. Probably more than one half of the organized woman labor of the country is to be found in the garment workers' unions. These organizations have carried on pioneer experiments in the United States with workers' education; their press has been distinguished by a type of discussion of current economic, social and political issues that could not fail to affect profoundly the outlook of their members.

The strength of the clothing unions, however, rests finally on the comprehensive industrial policy which they have applied to the problems of the clothing workers. The old autocratic management of the shop has in a large part of the industry entirely disappeared. Early in the history of the organization the principle of the preferential shop, whereby vacancies must be filled by union members unless there are none available or willing, was won. Discharge and even the most petty questions of discipline are no longer functions of the management alone; the

practise of reorganizing the shop in each slack period and discharging employees with whom the management is displeased has been brought under rigid control. By protection against discharge and by the provision that in slack seasons the work must be apportioned among all workers, security of the job is practically guaranteed. The many attempts of the employers since 1920 to retrieve the right of reorganizing their shops have not been successful, although an agreement with the union in 1928 granted the cloak and suit manufacturers some concessions in this regard.

The rise of the factory, the mounting productivity of labor and the progressive union policy have been reflected in striking improvements in the working conditions and earnings afforded by the industry. While there are still violations of the rules of the industry, prevailing hours of work since the war have been less than fifty a week and the two most important branches, men's and women's clothing, were in 1930 operating on a forty-four and forty-hour week respectively. Except for the small shops that persist in New York City and to a lesser extent in other large American cities the sanitary conditions in the modern clothing industries compare favorably with the most advanced plants of other industries.

Wages and methods of wage payment have been equally revolutionized. It is probably no exaggeration to say that wage rates in the unionized shops of the men's and women's clothing and fur industries were 300 percent greater in 1923 than in 1914. The task system has been completely abolished. Wages, whether piece or week, are everywhere fixed jointly by union and management. In fact, the extent of control over wages has in more than one instance imposed upon the union the responsibility for assuming similar control over the production of its individual members. Under the stress of stiff competition and adverse economic conditions union manufacturers have constantly sought relief from what they regarded as excessive labor costs by demanding either piecework or a substantial increase in production. In men's clothing the union has met this problem by accepting the practise of piecework, but in the women's garment industry, where an attempt to meet the difficulty was made by the use of production standards, the matter is still a subject of serious difference of opinion.

The record of wages and earnings is confused by seasonal and otherwise irregular employment,

to which all the garment trades are subject. Since 1914 the rise in the money incomes of all employees in the industry has been much more rapid than the increase in the cost of living, but in the most important parts of the industry earnings appear to have been decreasing since 1923. The range of wages, however, varies widely as between the union and the non-union shops and amounts in some cases to as much as 25 percent. Where the union is strong the prevailing rates of wages are among the highest in the country, and it is possible to find many shops in which average earnings for both men and women, skilled, semiskilled and unskilled, are between \$.80 and \$1.00 an hour. Such earnings are far above the wages which prevailed in these trades before the war. Annual incomes, nevertheless, everywhere remain low. In 1929 the average annual earnings of women's clothing workers were \$1309, of the men's clothing workers \$1184 and of the shirt makers only \$723.

The most difficult problem for the unions in all the needle trades is the policing of non-union shops, or, as it is described in the industry, the control of the "bundle." This problem, implicit in the character of the clothing business, is a perennial one and since the drop in prices in 1920 constant efforts have been made by the industry to revert to conditions prevailing before unionization. For the regulation of these conditions the unions have resorted to an elaborate machinery of control involving the registration of contractors, specifying the legal size of a contract shop, the conditions under which a contractor may accept work and the like; but the long struggle for the protection of union standards is not yet ended.

The problems arising from joint control by union and management have created many systems of industrial arbitration in the garment industries in the last twenty years. Both the Protocol of Peace in the cloak industry and the Hart, Schaffner and Marx agreement made provision for the arbitration of industrial disputes. From these slender beginnings in 1910 the practise of arbitration as a continuous function has become general in the organized sections of the industry. Under this system, which has had its most complete development in the men's clothing industry, there has been set up a detailed code of industrial law and judicial decisions, constituting in substance the rules and regulations for the conduct of labor relations in the industry.

Since bad years occur with appalling fre-

quency, the problem of unemployment has occupied a place of prime importance in the programs of the unions in the needle trades. Even in very good business years the average clothing worker will rarely work more than forty-five weeks, and neither the rule of division of work nor the steady reduction in hours has solved the difficulties of a year broken by long spells of idleness. Soon after the war the unions began to experiment with unemployment insurance, not in the form of traditional trade union benefit funds but as industrial insurance funds set up by agreement between the industry and the union. The first, based on a Ladies' Garment Workers' plan, was organized in the cloak and suit industry of Cleveland in 1921. It combined a guaranty of employment (set at 40 weeks in 1929) with provisions for the payment of unemployment benefits equal to one half the worker's wage. The fund is established by the employer and is not to exceed 75 percent of the pay roll. Over \$175,000 has been paid in benefits to the Cleveland workers since 1921. This plan was followed by the agreement between the Amalgamated Clothing Workers and the Chicago manufacturers which in 1923 created an insurance fund to which both workers and employers contribute. Over \$5,000,000 has been paid in benefits under this plan, which was adopted in 1928 in New York City and Rochester. In the same period the Ladies' Garment Workers' Union introduced the plan in New York and the cap makers' union created unemployment funds throughout their industry. These various arrangements have suffered from the vicissitudes of all such experiments and the plan of the Ladies' Garment Workers in New York has been temporarily suspended, but their adoption should be regarded as another significant step in the attempt of the clothing workers to solve their industrial problems through the power of their own organization.

Other activities of these unions, far afield from the customary preoccupations of organized labor, have been substantial gifts to Russia and investment of capital in Russian industry by the Amalgamated Clothing Workers in sympathy with the Russian Revolution, and the organization of two banks in Chicago and New York which were pioneers in the development of the small personal loan department and the lending of assistance to various cooperative enterprises. The cooperative apartments built and managed by the Amalgamated in New York City were among the first and most successful experiments in cooperative housing in the city. Since 1924

the Amalgamated has entirely changed the aspect of collective bargaining by making temporary loans to union employers in order to keep its members in employment and by setting up shops of its own under the management of the union, on one occasion to procure employment for striking members of the union and on two others to prolong the lives of businesses that were on the verge of liquidation.

In 1930 the garment workers' unions were again beset by old problems. Ten years of uninterrupted competition for the consumer's dollar against the lure of the automobile, the radio and the products of the electrical industry left the producers of clothes ill prepared to face a long and deep depression. The unions themselves have seen much of their strength sapped in the internal battles fought by adherents of the Socialist and Communist parties. This latest phase of their history, however, they entered with experience and resources which were not possessed by any of their predecessors in the cycle of attempts to organize the garment trades.

GARNEAU, FRANÇOIS XAVIER (1809-66), Canadian historian. Of humble birth, Garneau educated himself to be a public notary. Later in life he became a civil servant and in 1844 clerk of the municipal council of Quebec.

Garneau's reputation as a historian rests upon his *Histoire du Canada* (3 vols., Quebec 1845-48,

6th ed. by Hector Garneau, 2 vols., Paris 1920; tr. by A. Bell, 2 vols., 3rd ed. Montreal 1866), which introduced the scientific method into Canadian historiography. He was the first in Canada to regard history as "a rigorously analytic science," requiring a "severe criticism" of events and documents and obligating the historian to be well informed, independent and accurate. Faithful to his doctrine Garneau employs whenever possible original sources, orders his narrative methodically and is, if not always impersonal, invariably impartial. Although he occasionally lacks historical perspective and leaves almost untouched the fields of administration, religion and economics he has produced a work which has survived the test of new research and documentation. His style, while lacking color and movement, is impressive and dignified.

Conceived shortly after the punitive Act of Union of 1840 as a manifesto of the French Canadian tradition and rights Garneau's history revitalized nationalist pride and aspirations. Generations of French Canadians have been inspired by his story of a glorious past—basis of an inevitable survival. His doctrine that French Canadian destiny was bound to "the conservation of our religion, our language and our laws" became a leitmotif among Quebec historians and from it sprang a school of nationalist literature deep and far reaching in its influence and firmly establishing Garneau's reputation as the national historian of French Canada.

GARNIER, GERMAIN (1754-1821), French economist. As a politician Garnier was remarkable for flexibility. In the early stages of the revolution he won the confidence of Louis XVI and escaped the disfavor of the advanced revolutionaries by sojourning in Switzerland between August 10, 1792, and 1795; after the 18th Brumaire he adhered to the Napoleonic regime, under which he became president of the Senate between 1809 and 1811 and was made a count; in 1814 he voted for the deposition of Napoleon and was rewarded by the Restoration with a post in the Council of State and the title of marquis. Garnier's principal importance in economics arises from his having produced the first com-

petent French translation of Adam Smith's *Wealth of Nations* (5 vols., Paris 1802). Partly because of his innate flair for conciliating opposites, partly because of the ambiguity of the *Wealth of Nations* itself, Garnier was able to subscribe to the work of Smith without abandoning the ideas of Quesnay. His predominant point of view is contained in a lengthy note appended to the fifth volume (p. 290–315) and entitled “Des pouvoirs législatif et judiciaire et de leurs rapports avec la propriété.” In this note, which constitutes a synthesis of ideas and arguments presented by Garnier in a number of works and pamphlets ranging in time from 1792 to 1818, he adheres to the remnants of physiocracy in Smith's treatise rather than to its embryonic industrialism. The intrinsic value of the ideas contained in the note is that they represent the translation into political terms of the physiocratic exaltation of agriculture. Garnier insists that by virtue of their monopoly of the sources of sustenance the landed classes are the real controllers of the realm; that the fixity of their investments makes them in contrast with the mobile industrial class the only responsible repositories of power; and that for the general good their predominance should be recognized by the constitution. Since Garnier's interpretation stimulated the development of an opposite school of economic thinkers, men like Roederer and J. B. Say, who ignored the agrarian tendencies of Smith's treatise and derived from it the elements of a science appropriate to the regime of the industrial class, he had considerable indirect influence upon the beginnings of French classical economics. Among his few original contributions the most important is a timidly asserted theory of immaterial products, later to be developed by Say, Destutt de Tracy and Dunoyer.

(Paris 1819).

Consult: Allix, E., “L'oeuvre économique de Germain Garnier,” and “La rivalité entre la propriété foncière et la fortune mobilière sous la révolution” in *Revue d'histoire économique et sociale*, vol. v (1912) 317–42, and vol. vi (1913) 297–348.

GARNIER, JOSEPH CLÉMENT (1813–81), French economist. Garnier studied and later taught in the École Supérieure de Commerce

at Paris, and was also a lecturer in the Athénée. In 1842 he founded, with other economists, the Société d'Économie Politique. Having won recognition in 1846 by the publication of his *Éléments de l'économie politique* (3rd ed. Paris 1856), he was chosen the following year to inaugurate the chair of political economy at the École Nationale des Ponts et Chaussées and occupied similar chairs at several other institutions in Paris. He also became editor in chief of the *Journal des économistes* in 1845, a post which he retained with some interruptions until his death. Garnier played an important part in the French as well as in the international peace movement. In 1873 he became a member of the Institut de France. Garnier was an exponent of classical economics; his doctrine constitutes a mean between the extreme liberal doctrine of de Molinari and Yves Guyot and the less aggressive liberalism of J. A. Blanqui and Dunoyer. Garnier was encouraged by Blanqui to compile and edit the latter's *Cours d'économie industrielle* (3 vols., Paris 1837–38), and Dunoyer in a report to the Académie des Sciences Morales et Politiques praised his orthodoxy. Garnier lacked originality and instead of adapting the classical theory to his own times rigidly adhered to the principles elaborated by men like Turgot, Smith and Say for theirs. He edited and annotated Malthus' essay on population (Paris 1845; 2nd ed. 1852) for the well known series, the *Collection des principaux économistes*. He used the pessimistic conclusions of the Malthusian doctrine in his opposition to the reforms proposed by the socialists.

Consult: Renaudin, E., in *Nouveau dictionnaire d'économie politique*, vol. i (Paris 1891) p. 1097–98, with bibliography; Mischler, E., in *Statistische Monatschrift*, vol. vii (1881) 560–63.

GARRETSON, AUSTIN BRUCE (1856–1931), American trade union leader. Garretson was the son of a Quaker lawyer. After a brief apprenticeship to a wheelwright he took to railroading at an early age. Shortly after his initiation into the Order of Railway Conductors in 1884 he became prominent in its national organization and in 1889 left active railroading to assume the office of assistant grand chief. In 1906 he became grand chief (the title was changed to that of president in 1907), an office which he held until 1919. He remained with the organization in an advisory capacity until his death.

During his thirty years of office Garretson exerted a powerful influence in the general labor movement as well as in his own organization, which he helped to convert from a benevolent brotherhood into a protective union. He served actively as a member of President Wilson's Federal Commission on Industrial Relations from 1912 to 1915. He was chosen as chief spokesman for the four transportation brotherhoods in their espousal of the eight-hour movement which culminated in the passage of the Adamson Act of 1916 whereby a national strike was averted. In negotiations, debates and hearings before congressional committees he displayed keen wit and shrewd logic and an amazing knowledge of history, religion and philosophy as the product of self-education. He was a potent force in the progressive development of railway labor organization and an energetic supporter of the Plumb plan for the control and operation of the railroads.

GARRISON, WILLIAM LLOYD (1805-79), American reformer and abolitionist leader. Dissatisfied with the tepid humanitarianism of the time Garrison challenged public attention by his vigorous demand for the immediate and complete emancipation of the slaves. The agitation was carried on through the activities of the American Anti-Slavery Society, which he helped organize in 1833, and through the pages of his newspaper, the *Liberator* (1831-65). Garrison was a skilful journalist with a polemic style well adapted to the current standards of editorial writing. The virulent tone of his paper, which provoked rabid denunciation in the south and tended to prejudice even moderate antislavery opinion in the north, was not conducive to commercial success. Yet the *Liberator*, quoted and widely commented upon, exerted an influence far beyond its limited list of subscribers in aligning opinion and clarifying issues. Garrison struck at slavery from the outside, rallying

freedmen and a small, aggressive group of enthusiasts with his resounding words of exhortation. Although the dramatic quality of his agitation has tended to overemphasize at the expense of more fundamental economic factors his influence in the ultimate overthrow of slavery, he did succeed in forcing discussion which many sections of society, especially in eastern commercial circles, considered out of deference for the southern market impolitic. His uncompromising emphasis upon the moral evil and degradation inherent in the institution of slavery and his continued strictures upon various political leaders and groups tended more and more to isolate his radical followers from the main body of the antislavery movement. His distrust of the government because of its attitude toward slavery caused him to formulate doctrines which in their constitutional aspects partook of the anti-authoritarianism and anti-unionism prevalent in certain quarters. He stigmatized the constitution as "a covenant with Death and an agreement with Hell," and under his extremist leadership the great majority of the abolitionist party repudiated a union with slaveholders. The continued attempts of politicians to dodge the slavery issue were frustrated by the passage of the Kansas-Nebraska Act in 1854, which reopened the question as to the extension of slavery into the territories and precipitated the problem into national politics. Garrison's insistence on placing the abolition of slavery before the preservation of the union put him in a dilemma at the outset of the Civil War, but with the Emancipation Proclamation he urged support of Lincoln's administration.

GARY, ELBERT HENRY (1846-1927), American corporation lawyer and executive. Gary was for twenty-five years counsel for large corpora-

tions, in many of which he served as director, and participated in several important consolidations in the iron and steel industry. These consolidations culminated in the organization of the gigantic United States Steel Corporation in 1901, a combination arising directly out of increasingly turbulent competition. J. Pierpont Morgan, the financier of the combination, made Gary chairman of the board of directors with very wide powers.

Gary realized that the prevalent practises of large combinations were dangerous to the security of large scale enterprise. Competition had to be eliminated but combinations had to be "good." To avoid the charge of monopoly the United States Steel Corporation confined its direct control to less than half of the producing capacity of the industry. Gary openly preached cooperation in the industry: by means of the famous "Gary dinners" between 1906 and 1909 and the American Iron and Steel Institute, of which he was president from its organization in 1910 until his death, he fashioned machinery for the limitation of competition and the maintenance of prices. Uniform prices and minimum standards of competitive practise were accepted by the "independents," who in turn were tolerated by the dominant corporation. Public opposition, however, did not abate. The Gary dinners were abandoned under pressure and the institute could not become as effective as Gary might have wished. The federal government entered suit to dissolve the corporation but after more than a decade of litigation the United States Supreme Court in 1919 decided against the government.

Gary was always an ardent advocate of the open shop. The United States Steel Corporation crushed a strike in 1901 and has since never dealt officially with organized labor. Gary's administration developed one of the earliest schemes of employee stock ownership, which in practise was largely limited to the better paid employees, and an elaborate program of welfare, sanitation and safety. Union organization was repressed and Gary crushed the general strike of 1919. Although experience in the industry failed to support the validity of his arguments for the economy of the twelve-hour day, he consistently opposed reduction in hours until forced to capitulate in 1923 in response to an avalanche of public opinion.

Gary's distinctive contributions to industrial organization and practise lie in the fields of competitive policy and public relations. Through

the annual reports of the corporation he introduced greater publicity regarding corporate affairs than had hitherto been prevalent. He must be credited with an important share in the creation of the current attitude of tolerance toward industrial combinations in contrast with the earlier hostility of the public and government.

GAS INDUSTRY. The gas industry of the United States is essentially a public utility business supplying fuel gas for industrial, commercial and household uses. It includes a few publicly owned and operated municipal plants, but in 1927 the value of their output was only \$7,428,000 as compared with \$509,000,000 in the case of the public utility companies producing manufactured gas. This situation is in striking contrast with that in certain European countries, where a very large number of gas enterprises are publicly owned, usually by the municipalities. In England, for example, approximately three eighths of the gas works are public enterprises, and in Germany over three quarters of the gas is produced by public undertakings. The industry in other countries has a quasi-official status with intimate participation by the government in either ownership or operation. In the United States the gas industry is under public supervision, usually by state commissions or boards which have authority to regulate rates, services, security issues and general public relations.

The discovery of gas as a product which could be made by heating coal is commonly credited to van Helmont, a sixteenth century alchemist, who characterized the product resulting from the heating of certain solid fuels in a closed crucible as the *Geist*, or spirit, of the fuel. It is generally believed that the word gas has been derived from this original characterization. Gas remained a *Geist* until after the industrial revolution, when simultaneously in different countries intense efforts were made to develop the economic possibilities of gas. The first practical application of gas fuel was apparently made by William Murdoch in 1792, when he used coal gas to light his house and grounds in Cornwall, England. About the same time Philippe Lebon in Paris developed

a method of gas lighting, upon which he secured a patent. A German, F. A. Winsor, studied Lebon's ideas and tried to introduce gas lighting in Germany; he was unsuccessful there but went to London and in 1807 illuminated Pall Mall with gas. In the United States a number of attempts were made to use gas for street lighting. Winsor was one of the promoters of the first British gas company, which was chartered in 1812, and four years later the first American company started business in Baltimore. The development of the gas industry was the combined work of the three most industrially developed nations of the time.

Once its practicability had been demonstrated, gas lighting spread rapidly in spite of opposition which combined skepticism, prejudice and fear. Paris adopted gas lighting for its streets in 1820 and New York in 1823. By 1823 fifty-two cities in England were lighted with gas. In 1826 an English company introduced gas lighting in Berlin; a few years later a French company was formed to promote gas works in France and elsewhere on the continent. The use of gas in homes and factories also spread rapidly—the first American factory was lighted by gas in 1813. By 1859 there were nearly 1000 gas works in England, where the industry was most highly developed; 297 companies in the United States, capitalized at \$42,816,000 and serving 227,605 customers; twenty-three companies in Canada and fourteen in Latin America. The development of the gas industry was bound up with the general movement of economic advance, especially in England, where there was an intensive exploitation of the by-products of gas manufacture—carbon, coke, coal tars, ammonia. Where the tempo of economic advance was slower, the gas industry was retarded; in Germany, for example, only thirty-four cities were served by gas in 1850.

Despite its early crudity gas lighting proved superior to candles and fish oil. For a time its progress was threatened by kerosene and improved oil lamps, but the danger was overcome by cheapening the price of gas and improving its illuminating quality. The first gas burners were wasteful and smoky; the German Bunsen burner, invented in 1855, mixed gas with the air, produced complete combustion and gave a more intense, smokeless flame. This development was paralleled by more efficient production and distribution, including reduction of leakage from gas mains. After 1860 the industry made tremendous progress; in Germany expansion was

bound up with the growth of the dyeing industry and its demand for coal tars, a by-product of gas manufacture. In 1873 the successful production of water gas gave the industry a new basis for expansion. The threat of electric lighting was for a time met by again improving the quality of gas light. The open flame burner gave way to various kinds of mantles, particularly the Austrian Welsbach mantle, which by being heated with a non-luminous gas flame glowed brightly and gave more light than the bare flame. The use of the incandescent gas mantle, however, was not general until about 1890; and the inverted gas mantle, which permitted a large extension of illuminating service, was not introduced until about 1900. Despite these improvements gas, especially in the United States, was unable to meet the competition of electric light; as an illuminant gas was increasingly limited to low income homes, and its use still survives in many of the older tenements. In most European countries, however, gas and electricity are still competitors. But while gas was superseded as an illuminant by electricity, gas consumption in the United States increased enormously from other sources. At the same time that gas mantles were developed there was an active promotion of various types of gas cooking and heating devices, crude from a contemporary standpoint but for their time relatively convenient. The improvement of these devices opened up a great new demand. New uses were found for gas in industry, as a source of power and as a factor in many industrial processes, such as smelting. In 1860 an internal combustion engine driven by gas was perfected in France, and by 1880 there was a considerable manufacture of improved gas engines in both Europe and the United States. The increasing use of gas in industry and for cooking and heating stimulated gas output, which doubled between 1900 and 1914. The electric power industry is itself a large consumer of gas fuel: in 1929 power plants used 112,707,000,000 cubic feet of gas, an increase of 426 percent over 1919 and equal to the total output of the gas industry in 1901. Domestic, industrial and commercial customers of the manufactured gas industry increased from 4,200,000 in 1901 to 12,139,000 in 1929.

These developments were accompanied in the United States by the almost phenomenal growth of natural gas as a factor in the industry. For centuries natural gas had been a curiosity in Europe and Asia, and "burning springs" often inspired worship of gas as a fire god. Natural gas

was apparently first used for fuel or light in 1823 in Fredonia, New York, where the gas was piped to supply thirty burners. It was not, however, until 1872 in Pennsylvania that natural gas was collected and piped on a commercial scale. The exploitation of natural gas developed rapidly, until in 1930 it supplied more than half of the gas consumed in the United States, particularly for industrial purposes, and accounted for one half of the \$5,000,000,000 invested in the gas industry. Domestic consumers of natural gas increased from 875,000 in 1906 to 5,116,000 in 1929. The American natural gas industry is duplicated nowhere in the world either in type or in size. In a number of European countries where petroleum is found there is a tendency to develop a natural gas industry, especially in regions where other fuels for household use have been comparatively expensive; Bucharest, for example, is supplied with natural gas at the lowest rates in the world. But these developments are still comparatively insignificant.

TABLE I
GAS CONSUMPTION IN THE UNITED STATES
(In billions of cubic feet)

YEAR	MANUFACTURED GAS	NATURAL GAS
1906	123	389
1910	149	509
1915	204	629
1920	320	798
1925	421	1119
1929	524	1918

Source: American Gas Association, *Annual Statistics of the Manufactured Gas Industry* (New York 1930); United States, Bureau of Mines, *Natural Gas in 1929* (1931).

The two branches of the industry in the United States, although formerly quite distinct, have become so intertwined in a corporate as well as a technical sense that no sharp economic distinction can be made between natural and manufactured gas. In many cases the gas supplied to the public is a mixture of the natural and manufactured products and a large number of corporations, especially the major holding companies which dominate the gas industry, have subsidiaries of both types. Recently through the interlocked interests of public utility and petroleum enterprises in the production of natural gas there has developed a close relationship in some parts of the industry between the gas industry and the industry which produces, refines and markets petroleum and its products.

As the competition of gas with electricity in the illuminating field became less conspicuous, a large number of mergers of gas and electric

enterprises were effected in the United States. Electricity was applied most generally for lighting and power service; gas almost exclusively for heating service—water heating, incineration and many special operations as well as cooking and space heating. The gas and electricity supply industries are dominated by the same major holding companies, and competition is almost completely eliminated. This situation is in striking contrast with that in other countries, where competition between gas and electricity is still vigorous. In Great Britain, for example, gas lighting has retained an important place, as only the more modern homes are wired for electricity. Hence the supply of gas for household illumination is an extremely important part of the industry's public service. Furthermore, street lighting with gas still retains the more important place there, while it has been almost completely abandoned in the United States. The recent participation of public officials in stimulating electrical development in Great Britain has aroused considerable controversy and in some cases bitter political disputes between those groups urging a national electrical system and those interested in promoting the welfare of existing gas enterprises, especially those publicly owned.

In the United States the competition which exists between gas and electricity is almost completely confined to industrial heating. In this field gas because of its much lower cost per unit of energy supplied has usually been dominant. Yet in those types of industrial heating for which extremely close control is required or where automatic operation or regulation is essential electricity has gained an important foothold. The more modern types of industrial heating equipment using gas have been so perfected that this use is growing rapidly and invading many areas of activity, displacing oil and coal with great success. Greater cleanliness, improved factory conditions and the tendency to improve products because of closer heat control are the outstanding advantages which have enabled gas to displace the solid and liquid fuels which are often considerably cheaper per unit of energy supplied.

In 1930 in the United States approximately two thirds of the manufactured gas sales and approximately half the natural gas sales of public utility companies were for household purposes, including in each case a significant but not accurately determinable percentage for house heating. Industrial and commercial sales, including sales to restaurants and hotels as well as shops

and factories, account for the balance. There is a steady growth in the percentage of each type of gas sold for industrial heating purposes, a tendency that has not been altogether interrupted even by the industrial depressions of 1921 and of 1930-31, although total gas sales declined considerably during the latter period. Use for house heating has also increased in even larger percentage, but the quantity so employed in 1930 was still approximately only 5 percent of the total public utility sales of manufactured gas and probably not over 12 or 15 percent of the total sales of natural gas.

Because of the wide seasonal variation in the requirements a considerable use of gas for house heating offers some difficulty to the management of a utility enterprise, since short season use of equipment necessarily increases capital charges per unit. Industrial demand is, on the contrary, usually quite uniform throughout the year. These differences in the utilization habits of various classes of customers have led the industry to devise important and complicated rate structures, which have frequently occasioned controversy between gas companies and public officials (*see* RATE REGULATION). To lessen the variation in household demand new uses for gas during the summer non-heating season are especially encouraged. Both natural gas and manufactured gas companies have undertaken campaigns to develop interest in the fields of garbage and trash incineration, refrigeration and even house cooling. Especially in the two latter fields gas is intensely competitive with electricity, and in a number of cases holding companies with subsidiaries of both types have had difficulty in determining which source of energy should be given preference. Because of the earlier development of satisfactory equipment electrical devices have generally attained considerable advantage in this competition.

Typical operating companies in the manufactured gas industry are financed through issue of long term bonds covering a third to a half of their total capitalization, with both preferred and common stocks, often of several classes. Considerable capital is secured by sale of securities to customers; 245 companies in 1927 reported 684,438 customer stockholders owning considerably over \$500,000,000 in shares. Because of the high capital cost per unit of productive capacity the gross sales of such companies are typically about one third of the total investment. Capital charges consume a large percentage of the gross income. In many jurisdictions

state authorities govern the issue of securities and all other financial matters, including details of rates charged, cost keeping systems used and amounts which must be allotted to different reserves set up for retirement of securities or for provision against various contingencies.

High capital costs in the manufactured gas industry are accompanied by comparatively low labor costs. In 1929 wages constituted only 19 percent of the "value added" by manufacturing as compared with 36 percent for manufacturing industries as a whole. Although the output of manufactured gas rose from \$220,238,000 in 1914 to \$507,000,000 in 1929, the number of wage earners decreased from 43,792 to 42,853. Their average yearly earnings in 1929 were \$1393—slightly above the average of \$1308 for all manufacturing industries. Labor in both the natural and the manufactured gas divisions of the industry is rather highly specialized and in general is afforded continuous employment with comparatively low turnover. The only highly seasonal employment is in the construction work on mains and city distribution systems, where common laborers are usually laid off in slack times. As in the electric power industry, unionism is unimportant among gas company employees, although there are a few local unions of gas workers and sporadic attempts to organize. The industry carries on intensive "educational" work in order to "promote efficiency and co-operation" and to "set the employees right in relation to many fallacies, rumors and hostile movements." Employee ownership of company securities, retirement plans of numerous types, illness and accident benefits and employee representation schemes are essential elements in the relations between employee and management within practically all of the public utility divisions of the industry. These conditions also prevail generally in the British gas industry, where employee stock ownership was introduced by some companies as far back as 1890; in the United States employee stock ownership has been a considerable factor only since the World War and is as yet inconsiderable in the gas industry.

The manufacture of coal gas, the oldest division of the industry, waned rapidly, until in 1930 only approximately 11 percent of the manufactured gas was produced with retort coal gas equipment. Over 40 percent of the total send out of manufactured gas was, however, made in coke ovens; two thirds of this was produced in oven plants not owned or operated by the utility

companies, generally belonging to metallurgical enterprises such as steel or blast furnace plants. Such metallurgical enterprises frequently sell their "surplus" gas to public utility companies for city distribution, finding it more profitable to do this and to supply fuel gas for their own metallurgical furnace uses by cheaper means. A considerable number of public utility companies have built and are operating coke oven plants of their own. In these cases the gas becomes the principal product and the coke a by-product which must be sold either for metallurgical purposes, as a household fuel or otherwise. This development has been materially restricted because of the comparatively high value of coke as compared with gas, even though the net cost of the gas is very low whenever there is a favorable local coke market. To a limited extent the development has been restricted by the opinion of a few gas managements that it is inexpedient to enter the coke business and thus produce a household and industrial fuel which competes with their principal product, gas. A limited number of coke oven enterprises organized under independent ownership with long time contracts for gas with utility companies dispose of the coke and other by-products in markets outside the utility and the metallurgical fields. In general, however, the ownership and management of independent coke enterprises have been on terms of intimacy, if not actually interlocked, with the nearby gas utility companies.

During 1930 water gas manufacture accounted for approximately 45 percent of the total manufactured gas sent out of the United States. In this process anthracite coal, coke or bituminous coal at extremely high temperature reacts with steam to make first a "blue" water gas, which is then enriched by "carbureting"; i.e. by mixing with it a product of cracking of oil in the generating machine. The result, carbureted water gas, is of approximately the same heating characteristic as coal gas, although of somewhat different chemical composition. The relative advantage to the producer of making coal gas or water gas depends largely upon the comparative cost of the fuels used and the prevailing local market for coke, which is an essential coproduct with gas when the coal gas or coke oven process is used. Very frequently the most advantageous arrangement is to use both types of processes, operating the coal gas plant continuously at a substantially uniform rate throughout the year and using the water gas process to make the additional gas required by the distribution system in amounts

varying according to the seasonal fluctuation in demand. This use of water gas instead of coal gas as a means of varying send out results from the fact that the capital charge per unit of capacity is much lower in water gas plants than in any coal gas system, and seasonal use results in less unfavorable capital cost burden on the product.

Oil gas made by a variety of processes, principally in Pacific coast states, played an important part in the manufactured gas industry until the extension during 1930 of natural gas throughout practically all of California. The almost complete replacement of such oil gas processes by natural gas may be anticipated in the western states.

By-products of petroleum production and refining include several gaseous fuels which were formerly used merely as refinery fuel or thrown away. By liquefaction under pressure some of these products are now transported and utilized not only for admixture with other gas to furnish richer city supply but also independently both for small town gas supply and for independent isolated factory fuel gas service. The further development of the gaseous by-products of petroleum has been undertaken by certain refineries in cooperation with nearby public utility gas companies, and it is expected that a large amount of petroleum refinery by-product gas will be utilized for enrichment of city supplies. The total quantity of this gas available in 1930 was probably in excess of the total quantity of coal gas and coke oven gas utilized for public utility distribution, but only a very small percentage of the total was utilized outside of the petroleum refinery.

Natural gas production in the United States almost doubled between 1910 and 1920 and tripled between 1920 and 1930. Of the total production in the latter year about 20 percent was used for household supply through public utility systems. Over half of the total production was used in field operations of the natural gas and petroleum industry and in the manufacture of carbon black. The balance, about 30 percent, was utilized as a boiler fuel in electric public utility power generating stations, as a petroleum refinery fuel or in other industrial heating or steam raising operations. Only a small part of the 80 percent used industrially was distributed through public utility systems, the balance being handled by producing companies generally affiliated with petroleum enterprises. Natural gas production is concentrated in a small number of

states: in 1929 three quarters of the total output was produced in Texas, Oklahoma, California and Louisiana. Thus it is necessary to construct long distance lines to deliver natural gas over wide areas. In 1929 deliveries of natural gas to Mexico and Canada amounted to 242,000,000 cubic feet.

TABLE II

AMOUNT AND DISTRIBUTION OF GAS CONSUMPTION
IN THE UNITED STATES, 1929

	MANUFACTURED GAS	NATURAL GAS
Sales (billions of cubic feet)		
Total	524	1918
Domestic	359	360
Industrial *	163	1558
Value (millions of dollars)	533	413

* In the case of manufactured gas industrial includes commercial sales.

Source: American Gas Association, *Annual Statistics of the Manufactured Gas Industry* (New York 1930); United States Bureau of Mines, *Natural Gas in 1929* (Washington 1931).

Between 1927 and 1930 there was an intensive development of long distance transmission lines, which considerably increased the quantity of natural gas made available for city distribution. Formerly transmission lines more than 100 miles in length were considered generally uneconomical, but by 1930 lines were frequently over 500 miles long; in 1931 a pipe line of nearly 1000 miles was completed, at a cost of \$100,000,000, connecting Chicago with the natural gas fields of Texas. The distances at which gas can be delivered and sold are constantly increasing. With this development natural gas has invaded many areas where it is intensely competitive with manufactured gas, and in a large number of small communities it has completely displaced all older systems of supply. Almost invariably the displacement has been accomplished by the adoption of natural gas by existing public utility companies and the closing down of their former manufacturing works. In larger communities the displacement by natural gas has frequently been only partial and in those cases the city supply consists of a mixture of natural gas and manufactured gas. Long distance transmission of gas is being developed in Germany by the coke industry in the Ruhr, from where transmission mains convey the supply to distant towns and cities in competition with municipal plants.

The long distance transmission of natural gas in the United States has extended the use of gaseous fuel into many rural areas and particularly into small communities that were not sufficiently populous to warrant manufactured gas supply. This has increased the percentage of the

population which is served as interurban networks for gas distribution are completed. It is estimated that during recent years new investment for transmission systems and their accessories exceeded \$100,000,000, yearly. The distribution of natural gas within the city involves only minor technical differences; frequently, however, a skeleton manufacturing department must be maintained in order that production at the stand-by works may be quickly begun in case a breakdown in a transmission line prevents continuous flow from the natural gas field to the city. The development of natural gas in many areas formerly unproductive and the extension of transmission mains over much new territory have resulted in a physical interconnection of distributing systems formerly wholly independent. As a consequence gas can now be moved freely from city to city over wide areas, much as electricity is transmitted over interconnected networks. This physical interconnection has stimulated and accelerated the corporate mergers already set in motion by other factors.

The increase in plant efficiency, the substitution in some cases of natural for manufactured gas and the growth of interconnected systems have lessened the number of operating establishments. In 1929 there were only 715 establishments producing manufactured gas as compared with 1022 in 1919 and 1296 in 1909. Industrial concentration is, however, exceeded by the concentration of corporate control in the form of dominant holding companies with subsidiaries producing and distributing natural and manufactured gas, electricity and on a smaller scale other products. One of the most conspicuous is the Electric Bond and Share Company, which, with assets in 1930 of \$1,002,000,000, controls numerous subsidiary gas companies as well as electric power, water and traction enterprises. The Consolidated Gas Company of New York, with assets of \$1,282,000,000, controls numerous gas as well as electricity supply companies. The Cities Service Company, with assets of \$1,282,000,000, extends its influence beyond gas and electricity to include traction, water and petroleum enterprises. Another major holding company, the Associated Gas and Electric Company, had assets in 1930 of \$922,000,000. These and a few other great holding companies interlock the interests of the formerly independent gas and electricity supply industries.

The most recent world statistics give the following per capita consumption of gas: San Francisco, 12,500 cubic feet; London, 10,000; To-

ronto, 9,000; Frankfort, 5,900; Brussels, 4,100; Lille, 2,800. Not only has the use of gas increased in Europe, but there has been considerable modernization of production methods, particularly in Germany, France and England. Germany is the most important producer in Europe; its gas industry in 1928 had approximately 60,000 employees and an output of 129,000,000,000 cubic feet of gas. The use of gas is also increasing in the cities of Latin America and Australia. In Asia, however, with the exception of Japan, there has been little progress; thus the two gas works in Bombay and Calcutta are the only ones in India.

Gas sales per capita in the United States increased steadily during the decade 1920 to 1930 and in the latter year reached the highest point in history. In 1930 it was estimated that natural gas furnished approximately 8 percent of the total energy supply from all fuels and water power used in the United States, a percentage approximately double that of ten years before. Manufactured gas and other gaseous fuels made as by-products of coking and petroleum refining furnished approximately the same percentage of the total national energy supply. Hence nearly one sixth of the country's energy is utilized as a gaseous fuel. If present trends continue it is estimated that by 1940 fully 20 percent and perhaps as much as 30 percent of the energy supply as ultimately consumed will be in this form of gaseous fuel.

GASCA, PEDRO DE LA (1485-1567), Spanish colonial administrator. Gasca studied at the Seminary of Alcalá de Henares and at the University of Salamanca, became a priest and was subsequently chosen a member of the Council of the Inquisition. His diplomatic and energetic handling of the panic in Valencia, caused by the fear of a French-Turkish attack and the suspicion that a rising of the Moors was imminent, won him considerable renown. Probably because of his conduct on that occasion the crown appointed him president of the Royal Audiencia in 1546, entrusting him with the arduous task of dealing with the disturbances in Peru. The former viceroy, Blasco Nuñez de Vela, had failed to pacify the country because of his intemperance in enforcing the New Laws of 1542, which regulated the work of the natives; and as a result Gonzalo Pizarro ruled over Peru without authorization from Spain.

In his mission to Peru Gasca acted with consummate diplomacy. Adopting a policy of conciliation, he persuaded Hinojosa, the chief of Pizarro's fleet, to turn over his vessels to him. Pizarro himself was less inclined to accept Gasca's generous terms, especially after an unexpected victory at Huarina. He was, however, decisively defeated in 1548. During his stay Gasca undertook a series of reforms, which were facilitated by the fact that the program with which he had been entrusted had already been anticipated by Pizarro. He ordered uniform and

less burdensome taxes for the Indians, forbade the sacking of their villages and insisted that all *encomenderos* be provided with clergymen. While Gasca did not solve all the problems of the complicated Peruvian situation he nevertheless did succeed in establishing, primarily by peaceful persuasion, the authority of the crown, which had been accustomed to assert itself only by recourse to armed force of its loyal subjects.

CARLOS PEREYRA

GASOLINE TAX. A gallonage tax was first imposed in 1919 by the states of Oregon, Colorado, New Mexico and North Dakota to aid in the construction and maintenance of public roads. It was adopted in other jurisdictions in rapid succession, until within ten years it was in force in all states of the union, the District of Columbia and in several foreign countries. The charge is variously classified—simply as a tax, as an excise, as a license tax, an occupation tax and a privilege tax—and may be regarded as a commercial charge for the privilege of using vehicles of specified types on the public roads. It therefore closely resembles a toll, although not for the use of a particular piece of road. This theory had been developed by the courts in the registration fee cases before the advent of the gasoline tax. Such charges, it was held, are valid whether made under the police power to secure safety or made to secure “compensation for the use of facilities provided at great cost” by the state or its subdivisions [*Hendrick v. Maryland*, 235 U. S. 610 (1915); *Kane v. New Jersey*, 242 U. S. 160 (1916)]. The same reasoning has been applied to the gasoline tax and the same conclusion reached. While justifying the tax on these grounds in particular cases the courts have gone further, holding it an excise tax and its legality not dependent upon the use to which revenue from it is put.

The states have applied the use theory with a varying degree of rigidity and rarely with complete consistency. A few states devote a part of the revenue to non-highway purposes, although only 2.2 percent of the total yield was so used in 1929. Another practise inconsistent with the toll theory is that of collecting the tax from city consumers for use exclusively on roads outside city limits. There is, however, a tendency to recognize a city equity in the revenue by allocating a percentage of the receipts to

cities or by making a mileage allowance for state roads within city limits. A dozen states now make some such provision and the number is increasing. Another inconsistency lies in taxing gasoline not used in motor cars. Gasoline is usually defined in such a way as to include all liquid fuels usable in motor vehicle engines. Kerosene is generally excluded. Some states, e.g. New York and California, carry out the design to tax “persons who use the public highways,” by reimbursing those who consume the fuel in “any manner except in the operation of a motor vehicle upon or over the highways.” Other states exempt fuel used for specified purposes, as in agriculture, stationary engines, airplanes, motor boats, cleaning and dyeing. One third of the states, however, allow no exemption or refund on account of use, although some of these exempt fuel sold for exportation. Some exemptions are made because of the type of service the user performs. Rural mail carriers are often so exempted and all states are debarred from taxing gasoline used by a federal agency [*Panhandle Oil Co. v. Mississippi*, 277 U. S. 218 (1927)].

The administration of the tax except as to the provisions for refunds is comparatively simple and the cost is low, rarely exceeding 1 percent of the yield. Collection is generally made at the point of greatest concentration, i.e. as the fuel passes out of the hands of the “importer” or of the refiner. It is a common practise for major companies to pay the tax on all gasoline shipped into a state for sale at their service stations, but sales to jobbers and to retailers are made f.o.b. at the refinery, and these dealers thus become the taxpayers. The collection is made in most states by a state fiscal officer but in a few cases by the oil inspector or by the licensing authority. Dealers complained of the early laws that no allowance was made for losses by evaporation. A third of the states now make such an allowance.

The rate has shown a steady increase. As late as 1922 the rate in seventeen states was one cent, only two charging as much as two cents. The subsequent increase in the rate and in the number of taxing states is shown in Table I.

Whether viewed as a charge for the use of a public utility or as an excise for general revenue purposes, the tax has high merit. The extent of highway use and the damage to roadbed depend upon the weight and speed of the vehicle and the distance traveled, and the consumption of fuel is largely determined by the same factors.

TABLE I

RATES OF THE GASOLINE TAX IN THE UNITED STATES,
1923-29.

YEAR	NUMBER OF STATES WITH RATES PREVAILING AT END OF YEAR*							
	1¢	2¢	2½¢	3¢	3½¢	4¢	5¢	6¢
1923	15	11	1	7	—	—	—	—
1925	3	21	1	12	3	4	1	—
1927	—	13	—	16	1	11	5	—
1929	—	8	—	9	1	19	8	3
1931 (June)	—	6	—	9	—	18	11	6

Source: Compiled from *Public Roads*, and from *Facts and Figures of the Automobile Industry* (New York 1931).

* Not including the District of Columbia, which has had a two-cent tax since 1924.

Gasoline is a commodity well suited to excise taxation. It is an article of wide consumption and within the range of prices prevailing in the United States the demand for it is highly inelastic. The yield is abundant: in 1929 it exceeded the motor vehicle fees for the first time; the expense of collection is low; and the usual monthly payments accord with the canons of convenience and economy. The tax meets with little opposition, although the automobile and petroleum interests protest against the tendency toward excessive rates and against the diversion of the revenue to non-highway uses.

TABLE II

GASOLINE TAX YIELD IN THE UNITED STATES, 1925-29

YEAR	GASOLINE CONSUMPTION (IN 1,000,000 GALS.)		NET TAX EARNINGS (IN \$1,000,000)	TOTAL REGISTRATION FEES (IN \$1,000,000)
	TOTAL	NET AMOUNT TAXED		
1925	9,362	6,458	146.0	260.6
1926	10,708	7,884	187.6	288.3
1927	12,466	9,367	258.8	301.1
1928	13,811	10,178	304.9	322.6
1929	15,618	13,400	431.3	347.8
1930	16,613	15,763	494.6	355.7

Source: Compiled from *Public Roads*, from *Facts and Figures of the Automobile Industry* (New York) for 1930 and 1931, and from the *New York World* for May 4, 1929.

The tax has been adopted in other countries. All the Canadian provinces now levy on the imperial gallon a five-cent tax dedicated to highway use. Restricted by the act of 1867 to direct taxation, the provinces require retailers to collect the tax from consumers and pay them 2½ to 5 percent of the receipts for the service.

GASPARIN, COMTE DE, ADRIEN ÉTIENNE PIERRE (1783-1862), French agronomist and economist. Gasparin brought to the study of agricultural economics a scientific spirit and exact methods of observation unusual in his time. In 1807 he was appointed to the veterinary school at Lyons, where his interest in scientific study of the problems of agricultural improvement was aroused. He first won attention by the publication of various papers: *Le croisement des races* (Paris 1810), *Les maladies contagieuses des bêtes à laine* (Paris 1821), *L'éducation des mérinos* (Paris 1822) and a *Manuel d'art vétérinaire* (Paris 1817). Returning to his home in Provence, where he cultivated his own extensive property, he published observations on the condition of agricultural labor. Students still consult his *Des petites propriétés considérées dans leurs rapports avec le sort des ouvriers, la prospérité de l'agriculture et la destinée des états* (Paris 1820), in which he defended the system of small peasant holdings at a time when the partisans of absolute monarchy were endeavoring to obtain the reestablishment of large domains. Later he published a *Guide des propriétaires des biens soumis au métayage* (Paris 1828, 2nd ed. 1853) and a *Guide des propriétaires des biens ruraux affermés* (Paris 1829, 3rd ed. 1862). These fragmentary studies were a prelude to his *Cours d'agriculture* (5 vols., Paris 1843-51; 3rd ed., 6 vols., 1863), which has remained the foundation of agronomic studies in France. In it he discusses as an expert and with great thoroughness not only the systems of cultivation, organization and administration of rural enterprises but also the economic importance of agriculture and its relation to the state. From 1830 to 1839 he rendered valuable service in politics as representative, prefect, minister of the interior and minister of agriculture; in 1840 he was elected to the Académie des Sciences. In 1851 Gasparin was appointed director of the Institut National Agronomique, which had been founded as part of the government program for the furtherance of scientific agricultural educa-

tion but was suppressed under the Second Empire. From 1839 to 1856 Gasparin presented several papers, notably one on *La valeur des engrais* (Paris 1842), to the Société Centrale d'Agriculture and he published numerous articles in the *Journal d'agriculture pratique*.

GATSCHET, ALBERT SAMUEL (1832–1907), Swiss-American ethnologist and philologist. Gatschet is best known for his work on the aboriginal languages of America, pursued in the interest of the Bureau of American Ethnology from its foundation in 1879 until 1905 when he retired from its staff. While he made some valuable contributions to ethnology, particularly in his *Migration Legend of the Creek Indians* (2 vols., Philadelphia 1884 and St. Louis 1888), his great service lay in his records of various languages of the New World and the stimulus which these studies and his synchronous contributions to technical and other publications gave to linguistic research. He interested himself in an enormous number of languages—his manuscript material preserved by the Bureau of Ethnology, which represents only a part of his linguistic contacts, touches upon nearly a hundred. He recorded some languages, such as Atakapa, Karankawa, Comecrudo, Cotonam, Chitimacha, Tunica and Natchez, which are now entirely extinct or survive in the memories of but two or three individuals, and supplied much of the data entering into Major Powell's classification of the Indian languages ("Indian Linguistic Families of America North of Mexico" in United States, Bureau of Ethnology, *Seventh Annual Report*, 1885–86, 1891, p. 1–142), a work upon which all ethnological investigations in North America have been based since its appearance in 1891. Gatschet's monumental *The Klamath Indians of Southwestern Oregon* (Contributions to North American Ethnology, vol. ii, Washington 1890) was one of the first objective proofs of the extent and richness of Indian tongues and furnished an example of the possibilities for their study. Later and greater specialization, accompanied by modern linguistic technique, has superseded much of his work.

Gatschet was critical of the theoretical generalizations of Lewis Henry Morgan on aboriginal democracy in America and insisted on the existence of hereditary castes among the Natchez, Toltecs, Incas and Aztecs, a position

which has been substantiated by modern anthropologists.

GAUDENZI, AUGUSTO (1858–1916), Italian jurist. Gaudenzi was professor at the University of Bologna and is important in the study of legal history because of his work with mediaeval legal sources. In 1885 he rediscovered in the library of Lord Leicester of Holkham a manuscript of Italian origin which he believed to date from the end of the ninth or the beginning of the tenth century. It consisted of texts representing an admixture of Romanic and Germanic law and contained fourteen fragments of ancient Visigothic laws, which he attributed to King Euric (466–c. 84). He published these fragments (which today are known as the Gaudenzian texts) with interesting comments and augmented them by means of deductions made from a manuscript belonging to the Vallicelliana Library at Rome. The *Bibliotheca juridica medii aevi*, the publication of which he initiated, contains in the three volumes which were published in 1888, 1892 and 1901 (new ed. Bologna 1914) numerous unedited texts of the Bolognese glossators. In this study of public and private documents of the Middle Ages he used new methods to depict the history of mediaeval forgeries, expounding original doctrines concerning the preparation of documents and the office of the notary. In various periods of his life he devoted a great deal of energy to the history of the law schools at Bologna, Rome and Ravenna, presenting new hypotheses as to their interrelationship.

Consult: Brandileone, F., "Commemorazione del Professore Augusto Gaudenzi" in Reale Accademia delle Scienze dell' Istituto di Bologna, Classe di Scienze Morali, *Rendiconto*, 2nd ser., vol. i (1917) 17–55, where a bibliography of Gaudenzi's works is given; Solmi, A., *La storia del diritto italiano* (Rome 1922) p. 14–16; Conrat, Max (Cohn), *Geschichte der Quellen und Literatur des römischen Rechts im früheren Mittelalter* (Leipzig 1891) p. 277–84.

GAUDIG, HUGO (1860–1923), German educator. From 1900 to 1923 Gaudig was director of higher studies of the second girls' high school connected with the normal school and the practise school in Leipsic. He was an unusually suggestive and creative educator. His reforms grew directly out of the needs of his daily school work, and his writings are devoted to a discussion of

given and desired educational conditions. They present no systematic pedagogy, but a wealth of suggestion and great insight into matters of detail. Gaudig's first works dealt with the form of instruction. He tried to get away from the formalism of the Herbartian grades, seeking a psychologically sounder procedure. He argued from the standpoint of the pupil who must learn to work mentally, and he desired to teach through self-activity. Among advocates of the *Arbeitschule* Gaudig became the champion of the idea of education chiefly through mental self-activity as opposed to the largely manual program of Kerschensteiner. The teacher's main task was to organize the child's activity so that a personality might develop out of each individual by self-determination and self-education. The self-development of the natural person into a more perfect human type was the subject of Gaudig's chief writing. Arguing that a personality takes an active part, to the extent of its faculties, in the cultural life of the surrounding world, he demanded that the school be made into a realistic living experience, a cooperative community. Games, hikes, visits to factories and farms, and celebrations were to be part of a living school as much as formal teaching. Since the forces of life have their unity in national culture, he argued that the school must be founded on the latter.

Gaudig at first received little attention except abroad, but after the overturn of 1918 many of his demands were unusually rapidly recognized and many of his ideas accepted generally by pedagogues.

GAUDIN, MARTIN MICHEL CHARLES, DUC DE GAËTE (1756-1841), French minister of finance. During his training in the national bureau of the head clerk of finance, which he entered in 1775 at the age of nineteen, Gaudin prof-

ited by the extensive investigations which his superiors were making with a view to ameliorating the tax situation. He acquired an extraordinary knowledge of all matters pertaining to land taxation, upon which their efforts were principally concentrated. In the early stages of the revolution he was appointed one of the six commissioners of the Treasury but the atmosphere of revolutionary confusion was too repugnant to his superlatively systematic nature to allow his abilities scope. Twice he refused to accept the Ministry of Finance in the inefficient administration of the Directory. On the day following the eighteenth of Brumaire he eagerly accepted the same post from Napoleon.

Knowing how to take advantage of Gaudin's special knowledge and talents Napoleon found in him a highly valued and much heeded adviser. Gaudin retained his office through the entire period of the Consulate and the Empire and proved to be one of the most capable financial ministers in French history. It was he who was chiefly responsible for all those Napoleonic measures which so splendidly restored the nation's shattered finances: the abolition of progressive forced loans, an implicit declaration that revolutionary procedure had been abandoned; the creation of an office of direct taxation as a substitute for the system of leaving the assessment and collection of these taxes to elected officials, who had been remiss in the discharge of their duties; the revival of the practise of bonding receivers general in order to bind them to regular acquittal of their obligations; the creation of the Caisse d'Amortissement and of the Bank of France; the at first timorous but later more systematic reintroduction of indirect taxation; and, finally—the work in which Gaudin delighted—the preparation of the *cadastre*. So ardently and thoroughly did he perform this last task, which was enjoined upon him by a law of September 15, 1807, that by 1813, 10,000 communes had already been surveyed and 6000 of these had been audited by experts. The military reverses of 1812 and 1813 forced Gaudin to levy new taxes, which, however, the exhausted condition of the nation made it impossible to collect. After Napoleon's downfall Gaudin defended his government against the exaggerated charges of critics—such as Baron Louis, whom he answered in *Observations d'un anonyme*—concerning the amount of the financial deficit it left. During the Hundred Days he once more served as minister of finance, under the Restoration was member of the Chamber of Deputies and from 1820 to

1834 held the governorship of the Bank of France. Gaudin left several works of great importance for the financial history of his time; particularly significant from this point of view are *Mémoire sur le cadastre* (Paris 1818) and *Notice historique sur les finances de France (de l'an VIII-1800 au 1^{er} avril 1814)* (Paris 1818), both of which are included in *Mémoires, souvenirs, opinions et écrits* (3 vols., Paris 1926).

MARCEL MARION

Consult: Marion, M., *Histoire financière de la France depuis 1715*, vols. i-v (Paris 1914-28) vol. iv; Liesse, A., *Portraits de financiers* (Paris 1908) p. 121-57.

GEBHART, NICOLAS ÉMILE (1839-1908), French historian. From 1879 until his death Gebhart was professor of Italian literature at the Sorbonne. For him, however, a knowledge of literature was only one aspect of a comprehensive aesthetic and spiritual understanding with which he desired and was able to unlock the portals of the past, from antiquity to the end of the Renaissance. His two principal books are the work of a historian. *Les origines de la renaissance en Italie* (Paris 1879), published while he was still professor of foreign literatures at the Collège de Nancy, was an attempt to discover why the Renaissance began in Italy rather than in France and then to analyze in the early writings and works of art the genius of Renaissance Italy. To the study of this movement Gebhart brought not only the technique of a historian but the eye of a painter, the heart of a poet and the sympathy of a scholar who had served his apprenticeship in the study of ancient Greece. With unflinching insight he sheared the inconsequential element from the essential and united the latter in an illuminating synthesis. *L'Italie mystique* (Paris 1890, 3rd ed. 1899; tr. with introduction by E. M. Hulme as *Mystics and Heretics in Italy at the End of the Middle Ages*, London 1922) dealt with the spiritual life of Italy during the period of transition from the mediaeval age of faith to the Renaissance age of reason. If the very conception of *L'Italie mystique* implied a dismissal of the more realistic aspects of Italian life, Gebhart's treatment of such figures as Joachim of Flora, Francis of Assisi, Frederick II, John of Parma, Fra Salimbene, the Spirituals of the Franciscan order and Dante—like the study of Catherine of Siena contained in his *Les moines et les papes* (Paris 1896, 4th ed. 1907)—reveals a superb faculty of penetrating the religious and moral sides of the mediaeval mind. The

work as a whole is an invaluable synthesis of the results of researches made both by previous scholars and by himself. With the same rich yet always lucid style, with the same flair for the picturesque and the same insight, Gebhart wrote a series of biographies of individual Renaissance artists: *Rabelais, la renaissance et la réforme* (Paris 1877, rev. ed. 1895); *Sandro Botticelli* (Paris 1907, 2nd ed. 1908); and *Michel-Ange* (Paris 1908).

GEIGER, ABRAHAM (1810-74), Jewish theologian and religious reformer. Geiger served as rabbi in Wiesbaden, Breslau, Frankfurt and Berlin and wrote several valuable Jewish historical studies. He maintained that the Old Testament text had not been handed down intact but that intellectual currents of different ages had introduced propagandist changes. His studies cast new light upon the origin and tenets of the Pharisees and Sadducees and stimulated interest in the Jewish background of the gospels. Geiger applied the historical approach to contemporary Jewish life, which following the emancipation and the entrance of the Jews into the European cultural community was faced with a serious crisis. He was the first to use the concept of theology in Jewish circles and to propose its systematic treatment and founded the *Wissenschaftliche Zeitschrift für jüdische Theologie* (1835-47). He examined the existing Jewish ritual as the result of a process of development and drew practical conclusions from the historical criticism of the phases of its development. He sounded a call for fundamental, comprehensive reform of Jewish religion, tracing the crisis of Judaism to an overemphasis upon forms. He emphasized the teachings of the Old Testament prophets and their religious views and proclaimed the universality of Judaism as the goal of all religious training. He opposed the prevailing Jewish view of the oral tradition as the transmission of a doctrine received from God and handed down from generation to generation, holding it to be "the inward spirit, continually and creatively transforming, as it has awakened, come to expression, and continued in Judaism." Geiger

advocated these ideas in numerous published writings and sought adherents for them among his colleagues and in his congregation. Since he was regarded as the chosen champion of the Jewish reform movement he was refused membership in the rabbinical body of the Breslau congregation by its orthodox chief rabbi, who alleged that Geiger's attendance at a university proved him to be no true believer. The Breslau congregation thereupon in 1842-43 published a dissenting collection of rabbinical opinions regarding the compatibility of free inquiry with the rabbi's office which strongly influenced the future intellectual development of Judaism even among the orthodox. In the important rabbinical assemblies of 1844 to 1846 Geiger was a leader of the radical wing, advocating especially a reform of the marriage and Sabbath observance laws as well as the gradual elimination of Hebrew as the language of worship. Nevertheless, the prayer book he prepared in 1854 retained considerable Hebrew and varied from the traditional text only where urgent logical or dogmatic reasons made it imperative. He took no part in the far reaching reforms of 1845 made by the Berlin Reform-Gemeinde, because they seemed to him to constitute too radical a break in historical continuity. Later, however, in his *Jüdische Zeitschrift für Wissenschaft und Leben* (11 vols., 1863-74) he showed lively interest in and sympathy for American Reformed Judaism, which openly championed his principles. Although he failed in his lifelong effort to found a Jewish theological faculty in a German university, from 1872 on he lectured on the history of religion and Biblical criticism in the new Hochschule für die Wissenschaft des Judentums, where Felix Adler and Emil G. Hirsch, both of whom had an important influence on religious thought in America, were among his pupils.

ISMAR ELBOGEN

Important works: *Urschrift und Übersetzungen der Bibel* (Breslau 1857); *Nothwendigkeit und Mass einer Reform des jüdischen Gottesdienstes* (Breslau 1861); *Das Judenthum und seine Geschichte*, 3 vols. (Breslau 1865-71), tr. by C. Newburgh (2nd ed. New York 1911); *Über die Errichtung einer jüdisch-theologischen Facultät* (Wiesbaden 1838); *Nachgelassene Schriften*, ed. by L. Geiger, 5 vols. (Berlin 1875-78).

GEIJER, ERIK GUSTAF (1783-1847), Swedish historian and social thinker. Geiger was educated at the University of Uppsala and

taught there for a long time. After some years spent in collecting materials and after a preliminary work, *Svea rikets häfder* (Uppsala 1825), in which he analyzed the sources of Swedish history and revealed his point of view, he published his *Svenska folkets historia* (3 vols., Örebro 1832-36; tr. by J. H. Turner, London 1845), which was the first national history of Sweden and which carried the narrative down to 1654.

Throughout most of his career Geiger was a romanticist in his outlook upon history and literature and a conservative in his attitude toward social and political problems. But he gradually came to see that the old aristocratic regime could not be maintained indefinitely. Through his study of German philosophy he had learned to appreciate the dignity, the rights and the importance of the human personality. This principle of personality became the central thought not only in his philosophic system but also in his religious and political beliefs. A man who was worthy of citizenship in the kingdom of God was, he believed, worthy of every other citizenship. Holding this doctrine he could not long remain in the conservative camp. Early in 1838 he issued a manifesto in which he declared for better public schools, free competition, widening of the suffrage and a more liberal program in higher education.

Geiger was at the time one of the most influential men in Sweden. Through his lyrics, his hymns, his musical compositions, his public addresses, his philosophic essays and his historical writings his name had become known in every village in the country. His "apostasy" was therefore an event of the first importance. It gave a new direction to political thought and forced the current of history into new channels.

GEISTESWISSENSCHAFTEN. The term *Geisteswissenschaften* first came into use as the German translation of John Stuart Mill's "moral sciences" and in its most general sense is applied to the moral and mental as distinguished from the natural sciences. The peculiar connotation which it has acquired, however, in the course of its development in Germany makes it almost

impossible to translate the term into any other language. It has been recognized since the dawn of scientific thought in ancient Greece that the approach to reality for scientific knowledge varies, depending on whether this reality is physical or mental and whether the approach is based on outward experience or introspection. The strong prevalence of mathematical and quantitative methods of observation and induction that has characterized the development of modern natural science since the time of the Renaissance implanted in the leading western nations an equally strong inclination to identify this particular scientific ideal with knowledge generally. The world of mental experience was consequently either to be left outside this exclusive pale or admitted only on condition of a more or less complete subjection to this ideal. The nineteenth century even brought a further victorious extension of the realm of natural science by the effective constitution of an experimental psychology on the foundations of David Hume's doctrine of apperception and association.

The German concept of *Geisteswissenschaften* is an open revolt against this conquest of mental experience by western science. Germs of this concept are found in the protest of the Italian, Giambattista Vico, against the mathematical treatment of language, culture and society, and more especially in the works of F. A. Wolf, A. Böckh and J. G. Droysen. The methodical and systematic preoccupation with this problem, however, began at the end of the last century with the two markedly antinaturalistic positions of Wilhelm Dilthey and the "southwestern school" of German philosophy led by Windelband and Rickert. Dilthey combated John Stuart Mill's logic of moral sciences and the experimental psychology and Comtian sociology that followed it and in their place aimed to set up a system and methodology based on an understanding (*verstehen*) *sui generis* of history and society. The southwesterners developed a distinction drawn in western science by A. A. Cournot between the nomothetic, or generalizing, character of the physico-mathematical group and the ideographic, or individualizing, character of the historical or cultural group of sciences; and they superimposed on this distinction their doctrine of the difference between the knowledge of being (*Sein*) and the consciousness of and relation to norms (*Sollen*), thus inaugurating the famous discussion on the role of value judgments in science; the debate of this question crucial to the young social sciences has since spread

beyond Germany. These ideas soon began to permeate the whole range of the social sciences in Germany and have been especially influential since the World War. The writings of Rudolf Stammler and Hans Fehr in jurisprudence and the historical works of Troeltsch, Meinecke and the whole group of writers of *Geistesgeschichte* reveal the imprint of these methodological principles. In economics and political science a sort of compromise between the attitudes of Dilthey and the southwesterners has been worked out by Max Weber in his doctrine of "ideal types" that are to take the place of mechanical laws in the analysis of social facts and by Werner Sombart and his *Geistwissenschaft* (as he says instead of *Geisteswissenschaft*); that is, to replace the two older forms of political economy, the "value judging" (*richtende*) and the "law finding" (*ordnende*), by a third, a kind of synthesis of the former two, to be called the "understanding" (*verstehende*) from the peculiar relationship and imminent character of this knowledge.

Several valuable strains of genuine feeling for the constitutive principles of the social sciences seem to be contained in the concept of *Geisteswissenschaften*. It is true that there is a certain danger that unscientific mysticism might result from this violent rupture of the unity of scientific effort. But even in Germany the original sharp distinctions drawn between the different aspects of the concept have been giving way to a more continuous interpretation of the methods of mental knowledge in their relation to physical knowledge; this development has been promoted, it is important to note, by the contemporaneous process of transformation of the rigid classical and atomistic concept of causality in the natural sciences. The "understanding" of social phenomena as mental facts and complexes is no longer viewed as quite the immediate and direct approach which it appears to be to naïve introspection. The peculiar role of values in social reality is ceasing to be regarded in the light of a dualistic split between factual and non-positing statements, and as a result of the writings of Edmund Husserl, Max Scheler and Nicolai Hartmann the ban on "value judgments" in the social sciences has given way to careful and critical researches into their structure and systematic connection. The lasting merit of the German idea of the *Geisteswissenschaften* is that it has drawn attention to the impossibility of the uncritical parallelism frequently found in the western social sciences between mechanical evolution in the naturalistic sense and a rigid

system of values thought to be realized through the "progressive" unity of this evolution.

GELASIUS I (died 496), pope from 492 to 496. The work of Pope Gelasius I is of great importance in the development of the mediaeval and modern ideas of the relation between church and state. It was he who first formulated in clear and precise terms the dualistic conception of their relation. Since the conversion of Constantine there had been some tendency even in the west toward the idea of a unified Christian society under the leadership of a Christian emperor. But the western church had finally repudiated such a view; its own claims had been stated before Gelasius' time by St. Ambrose, who dogmatically asserted not only the freedom of the church but its sovereignty in spiritual matters even over the emperor himself. It remained, however, for Gelasius to give clear expression to the complementary conception of the state's independence and supremacy in temporal matters. In his fourth *Tractatus* Gelasius declares that before the coming of Christ certain persons were legitimately both kings and priests but that in view of the feebleness of human nature Christ, who was himself the true and perfect embodiment of the priest-king, separated the two offices and gave to each its peculiar functions and powers. In his twelfth *Epistola* Gelasius states this view as a principle. The world is ruled by two authorities, the sacred authority of the pontiffs and the royal power. The Christian emperor needs the pontiff for the attainment of eternal life; the pontiff depends upon the government of the emperor in temporal matters. Gelasius thus provided the Middle Ages with the literary form for the dualistic principle of authority which it

was their normal tendency to accept and which in spite of their difficulties and conflicts they in their turn handed down to the modern world. These writings of Gelasius may be found in *Epistolae romanorum pontificum genuinae a S. Hilario usque ad Pelagium II*, edited by A. Thiel (2 pts., Braunsberg 1867-68).

GENERAL PROPERTY TAX. The general property tax is a tax on property in general without differentiation according to class or characteristics. The concept embraces three elements: first, all property is taxed as a homogeneous mass; second, the entire mass of property is assessed or valued for taxation according to a uniform rule; third, all property within any taxing jurisdiction is taxed at the same rate. This emphasis upon uniformity of rate and valuation has caused the system to be designated popularly as the uniform rule. The theory underlying insistence upon uniformity of tax rate and valuation was apparently that the aggregate of property of all sorts owned by any individual provided a suitable and all sufficient measure of his tax obligation. The taxation of all property by a uniform rule was presumed to reach all who should pay taxes and to reach them in an equitable manner.

The general property tax represents an intermediate stage in the evolution of property taxes. The course of this evolution, which is characteristic of the fiscal development of practically all countries, is illustrated in the fiscal history of the older American states. In the earliest stage of property taxation different kinds of property were enumerated and were taxed sometimes ad valorem, sometimes on a specific basis. As the wealth of the community expanded, the statutory enumeration likewise grew longer. The transition from specific property taxes to a general property tax occurred when the legislature abandoned the detailed enumeration and substituted a blanket reference to taxable property. Instead of enumerating the forms of property to be taxed, the tables were reversed and all property not specifically exempted was declared to be taxable. The uniform application of certain rules of valuation and assessment completed the change to a general property tax. The differentiation of property, and especially the increased

importance of intangible property have rendered the uniform rule of property taxation wholly inadequate. In a number of states the general mass of property is being broken up into classes, each of which is being taxed by methods appropriate to its peculiar characteristics.

Conditions of early American life were favorable to the acceptance of the general property tax. Property ownership, especially in land and the type of movables commonly associated with the land, such as livestock, carriages and farm products, was open to all persons with initiative. The abundance of free land prevented the development of large social classes that were traditionally dissociated from property ownership. There was comparative absence of those groups which derive incomes from personal services rather than from property. The early exemplars of the personal service groups, whether laborers or lawyers, had not yet begun to command such rewards for their services as to bring them conspicuously to the notice of the taxing authorities. Economic and social conditions favored the assumption that property ownership was the chief if not the sole index of taxable capacity. Property was the mark also of political importance, since the suffrage was generally restricted by a property qualification until after the close of the eighteenth century.

The intensely dynamic character of early American life favored also the development of other characteristics of the general property tax; namely, the use of the capital value rather than the annual income value as the basis of the tax and the reference to the market for the determination of the capital value. In a stable, more or less static society the annual income from fixed property becomes the significant aspect of property ownership; in a dynamic, unstable society future increments in capital value are more important than current returns. The tax laws naturally adopted, both in Europe and America, the predominant characteristic of property. In Europe this led long ago to the taxation of real property on its annual income value, and in America it led to taxation on the capital value.

The abundance of land and the migratory habits of the population from early colonial times prevented the American people from developing the disposition to cling to chosen land-holdings and other possessions. The European land market was frozen. Land hunger led to hereditary holdings, even with minute subdivision, to keep the land in the family. This reluctance to sell extended in a lesser degree to other

property. There were always enough persons in America who were ready to sell "lock, stock and barrel" to provide a free market for practically all forms of property. The general property tax assumed a free market in which the assessor could always ascertain and measure values from the actual sales of property similar to that which he was assessing for taxation.

The pattern of the general property tax followed a conventional design which became well nigh universal through the process of statutory imitation. In nearly every state it acquired constitutional status and thereby a sanction which caused it to endure long after its defects had been thoroughly exposed. The typical constitutional provision declared that all property except that specifically exempted should be taxed on a uniform basis and at a uniform rate. The exemptions included public property and that used for religious, educational and charitable purposes. Small amounts of personal property were ordinarily exempted to each taxpayer, while larger amounts were sometimes exempted to selected classes such as veterans and their widows. In some states the full scope of the exemptions reflected the predominant economic interest, agriculture, and the further exemption policy applied more frequently to young livestock, growing crops, products unsold on the farm and the like than to other forms of wealth.

The basis of assessment was expressed in a variety of phrases, such as "true value," "market value," "fair value in money." All of these expressions were simply variations of the basic concept that value for taxation purposes is established in a free market. It is the amount that would be paid for the property in a voluntary transaction between a willing buyer and a willing seller.

The assessment of property was made by an assessor or a board of assessors. This official was ordinarily elected in the district which he served, although in some of the larger cities he was appointed by the mayor or the governing body. The assessment district was the city, town or township in all of the older states in which the town form of local government was important. In some southern and western states the county was the important unit of local administration, and the assessor there became a county official.

The assessment was made as of a fixed date and the selection of this date was determined in large part by the convenience and advantage of the dominant rural group, although the fact that the assessor usually had another occupation may

have contributed somewhat to the practise of arranging that the work be done in the slack agricultural season. Assessment dates were therefore either in the late autumn or the early spring. These dates have persisted even in the states in which industry and trade have overshadowed agriculture, although they have no necessary relation to the prevailing fiscal periods for business or for the governmental bodies themselves. To obviate seasonal variations in the case of merchants' and manufacturers' stocks many states introduced the assessment of such property at its average monthly value.

In theory, the assessor was to inspect and appraise the several parcels or pieces of property and fix his valuations in the light of his knowledge of selling prices or by reference to market conditions. In practise, there was much copying of the records of previous years and a minimum of that vigorous exercise of the judgment and the intellect which the theory of the general property tax required. Elaborate blank forms were designed, particularly for personal property, in order to aid the assessor in securing complete statements of taxable property. These returns were to be sworn to by the taxpayer, and the assessor was usually required to support his assessment with an affidavit that he had actually complied with the law.

The total tax levy upon the assessed value was made up of the separate rates for state, county, municipal and school purposes together with any levies for other specific purposes as determined by law. The state tax might be collected at a fixed rate, or the rate might be determined by dividing the total state assessment into the sum required for state purposes. The former method has been the more usual, and some states have limited by constitutional provision the rate which might be levied on property for state purposes.

The taxpayer became delinquent if the tax was not paid by a certain date, and the tax lien thus established could be satisfied by seizure and sale of the property. The owner was usually given a period of years during which he could acquire title again by paying the accumulated taxes, with interest and sometimes a penalty in addition.

The general property tax served during a long period as the principal source of both state and local revenue. Although the general property tax is dissolving into a series of taxes on classes of property, a large proportion of all state and local taxes is still obtained from property taxes

despite the development of supplemental revenue sources.

With the increase in the amount and complexity of wealth, the general property tax proved to be an increasingly unsatisfactory form of taxation. The most fundamental defects were those inherent in the basic theory of the tax itself. Because of these defects the administrative difficulties became increasingly serious.

The theory of the general property tax proved defective in two essential respects. In the first place, the course of economic evolution during the nineteenth century produced an extensive differentiation in the character and composition of property. There was a vast division of property into tangible things and intangible rights and interests. The rise of the modern credit structure and the growth of the corporate form of business organization were the two most significant factors in this process of differentiation. While these intangible rights and interests are in fact a species of property and while their development has had highly important consequences from the standpoint of the use and management of and the income from the tangible wealth of the community, they are for the most part merely representative wealth. The general property tax treated representative wealth as independent property to be taxed exactly as the underlying physical wealth. It added together the corporation's tangible assets and its stocks and bonds. Many states recognized the essential injustice of this kind of double taxation to the extent of exempting the stocks of domestic corporations. Although such legislation was often clearly unconstitutional it was seldom contested.

The second defect in the theory of the general property tax was in its assumption that property is an all sufficient measure of taxable ability. This assumption ignored the development of the personal service occupations and the large incomes which were obtained by many skilled and professional groups. Full information on this point is still lacking, but the federal income tax returns show that wage, salary and other personal service incomes comprise about 40 percent of all incomes reported by the small group of persons subject to that tax.

The failure to recognize the changes in the forms and character of property gave rise to serious administrative difficulties. The assessor could not assess intangibles on inspection, since he could not see them and could have no certain knowledge of their existence. The escape of intangibles from taxation continued, and tax

rates on tangible property rose rapidly as governmental costs increased. Each advance in tax rates stimulated further evasion, and even in those states which made most strenuous efforts the amounts of intangibles actually assessed were but a very small proportion of the total amount owned. In 1928 Ohio assessed \$723,332,000 of intangible property owned by individuals and corporations. A special investigating commission has recently estimated the total intangible wealth owned in the state at \$15,703,985,000.

The pressure of rising tax rates gave rise to other administrative difficulties. Undervaluation was attempted where sequestration could not be accomplished. As the size of individual property aggregates increased, the technical equipment and the intellectual capacity of the average assessor were subjected to greater strain. These problems of valuation would appear under any system of property taxation; they appeared first, however, under the general property tax. A partial solution was provided by transferring the assessment of public utilities to state boards of assessment. This reform left untouched the fundamental problem of uniform property assessment, since the local assessors continued to produce very unequal results in their treatment of the general mass of property. These results may be summarily stated as a tendency toward regression; that is, small properties were often assessed at higher percentages of true value than large properties. An exception to this tendency was recently disclosed in Chicago, where the proportions of assessed values to real values were greater in the high value districts with a small voting population than in the residential sections where the voters lived. Detailed analysis of assessment tendencies in some states, notably Wisconsin, has revealed a higher assessment basis for rural than for urban property.

The assessment of personal property has given rise to administrative problems of another sort. The difficulty here has been in finding the property rather than in its correct appraisal, although the proper valuation of large stocks of merchandise or materials has been as much beyond the capacity of the average local assessor as would be the proper assessment of high value real estate. In some eastern states, particularly New York, the taxation of personal property has been largely discredited by *pro forma* assessments of nominal amounts or by the doomage assessment of large amounts against individuals chosen more or less at random, with the privilege of "swearing off" the assessment.

Inequalities in assessments proved to be a serious administrative difficulty from the earliest stage of the general property tax. The first step in providing for the review and adjustment of assessments, known as equalization, was the creation of local boards of equalization. These were supposed to hear appeals from aggrieved taxpayers, examine the assessor's lists and equalize the assessment. The obvious inability of local boards of equalization to afford adequate relief led to the creation of state boards of equalization. These boards had no technical equipment for the task and no great relish for it. The resulting state equalization was usually a "log-rolling" process. The creation of state boards of equalization and of state boards of corporate assessment was followed by the organization of state tax commissions. These commissions often absorbed the duties of the earlier boards, but their distinctive function was the supervision of the local assessment. The more vigorous commissions were able to show decided improvements in the direction of more equitable assessments, but they were wholly unable to restore the general property tax as an equitable form of taxation.

A similar result befell other administrative remedies. "Tax ferrets" were authorized in a few states to ferret out evaders on a percentage basis. Naturally they aimed at the few conspicuously wealthy taxpayers but did nothing to correct mass evasion by the rank and file of taxpayers. Inheritance tax laws provided for disclosure of the contents of safety boxes for the purpose of imposing penalty assessments on unlisted intangibles. While these devices somewhat broadened the taxable base, they were quite incapable of securing a complete assessment of intangibles for taxation at high rates.

As a consequence of the theoretical defects and the practical administrative difficulties, the adequate assessment of personal property became increasingly difficult, and the general property tax moved steadily in the direction of a tax on real property only. Had this tendency been allowed to continue without interruption, the American experience with property taxation would have paralleled the English and continental experience. The combined influences of statutory exemption and of unchecked evasion would in time have effected the transformation of the general property tax into a real property tax.

There is some sentiment in the United States for permitting and encouraging this transforma-

tion, but there is an even greater weight of opinion in favor of retaining a fairly broad system of property taxation, under which the mass of property should be resolved into classes, each of which should be taxed according to its peculiar characteristics. The strength of this movement for a diversified property tax is derived from the belief that personal property is a beneficiary of governmental services in the same or even in greater degree than real property.

The passing of the general property concept meant a transition from taxation *in personam* to taxation *in rem*. Modern diversified property taxes are not aimed at the ability of the owner as a person to pay taxes. This element of personal ability to pay is now being reached by another tax which is far more exact for the purpose, namely, the personal income tax. Realization of the superiority of this test of personal ability hastened the abandonment of the effort to measure total ability by total property, a method which could never be adequate even as regards property owners except under a single comprehensive taxing jurisdiction, to which each would report his entire property. The property tax therefore ceased to be regarded primarily as a form of personal taxation, but rather as a tax against the property as a thing.

Under this view, it is difficult to justify logically any exemption of classes of property. Each class receives governmental protection and other services which are given to the property as such and not to the owner as such. The owner of a stock of merchandise may live in another county or another state or a foreign country; yet the merchandise is protected by police and fire departments and by the courts, and it is served by every governmental agency as fully and completely as if the owner were a resident of the district in which it is located. The substitution of any kind of lieu tax for the property tax on any class of property, whether for reasons of administrative advantage or otherwise, should be recognized for what it is, and should not operate to relieve the owner of his personal obligations under any form of personal taxation which may be developed.

The diversification of property into classes, for the purpose of taxing each class in a manner and at a rate appropriate to its characteristics, has resulted in two principal methods of reform, as the evolution of property taxation advanced from general to specific property taxes.

The movement for the classification of property for taxation was the first important reform

development. The primary segregation was between tangible and intangible property, and many states adopted this classification. Intangibles are taxed at low, flat rates. As a result of this reform enormous gains have been registered in the volume of such property assessed and substantial increases in the revenue collected. It has not always been realized, however, that the successful operation of a low, flat rate tax on intangibles demands strict supervision by the tax commission.

Elaborate classification of tangible property has not been undertaken in many instances. The practical result of such schemes in Minnesota and Montana, for example, has been the singling out of a specific type of activity, particularly mining, for relatively severe taxation. It must be concluded that the principal benefits from a scheme of classification are realized in providing for separate treatment of intangibles and that little advantage is to be derived from an elaborate grouping of tangible property into classes to be taxed at different effective rates.

A second line of reform, which has been less generally adopted, has been the taxation of intangibles on an income rather than a capital value basis. Massachusetts taxes at fixed rates interest and dividends, income from annuities and gains from dealings in intangibles. New Hampshire taxes interest and dividends at the average rate of taxation on other property. The comparative tax burden on a 6 percent bond for \$1000 in these states and in Minnesota, where the rate is three mills on the dollar of capital value, would be in Massachusetts \$3.60, in New Hampshire \$1.69 (at the average property tax rate of \$2.80 per \$100 in 1929) and in Minnesota \$3.00. While the tax in New Hampshire is less than half that of Massachusetts, the general result of these newer methods, that is, of a flat tax on the capital value or a moderate tax on the income value, is roughly the same. Either is a satisfactory and equitable remedy for the excessive taxation of intangibles under the high rates of the general property tax. From this standpoint the choice of remedies becomes a matter of preference or of political expediency. The Minnesota plan will derive revenue from non-dividend stocks which have a market value because of prospective earnings, just as the capital value method derives revenue from idle land held in anticipation of an increase in value.

The taxation of intangibles in Massachusetts and New Hampshire, although popularly known as income taxation, is not to be confused with

the personal income tax, which is levied against the person and is based usually on the entire personal income from all sources. The two states mentioned are employing the income rather than the capital value basis for taxing specific forms of property. In other words, they are employing the principle of property classification, with a further differentiation in the basis of the tax in the case of intangibles. They are therefore observing the rule of universality in that all property is taxed in some manner; but they have abandoned the rule of uniformity of method and rate, which is an essential feature of the general property tax. Should either of these states introduce a thoroughgoing personal income tax, it would be entirely proper to include interest and dividend income along with the income from tangible property and personal services without modifying or repealing the existing taxes, which have here been considered to be special types of property taxation. In a number of states which now use the personal income tax the error has been made of assuming that the inclusion of income from intangibles was a sufficient warrant for the complete exemption of intangibles as property.

Another aspect of the reform movement is the development of special business taxes. The general property tax applied to the property used in business as to other property, but the growth of large business units demonstrated anew the inability of the local assessor adequately to value such properties. There was no free market for factories, steel mills, apartment houses and similar large aggregates. In the absence of a suitable technique for arriving at a taxable basis an effort was made to overcome the deficiencies of the local assessment by taxing the corporate excess; that is, the excess of the value of the corporate stock over the taxable value of the tangible assets. The stock market valuation of the stock was accepted, although the judgment of this authority is not always reliable. Closely held stocks were valued by the tax commissioner, whose judgment and knowledge of such values were better than those of the average assessor. Massachusetts and other states which once used the corporate excess have found it unsatisfactory and have reacted toward a business tax based directly on net income instead of on a valuation of stocks based on other people's judgment of the significance of the income.

Thus at least three different taxes are found to be necessary to cover the field which was

once supposed to be covered adequately by the general property tax. These are a tax or taxes on the several classes of property, a business tax and a personal income tax.

The evolution of tax systems toward a highly diversified group of taxes has proceeded much farther in Europe than in the United States. There the pressure for revenue has been such that no conspicuous taxable object could escape notice for very long. The general property tax disintegrated centuries ago in England and on the continent, but the taxation of specific forms of property, of business and of incomes has continued with increasing severity. The general property taxes in Germany, the Netherlands, Denmark, Austria and Hungary, are of a supplementary nature. They are intended to reach wealth escaping other forms of taxation, particularly the income tax, and to subject earnings from property to a heavier tax burden by taxing the property as well as the income. The rates are kept low and the yield has been moderate, both absolutely and in relation to total revenues.

GENERAL STRIKE involves the sympathetic cessation of labor by the majority of the workers in all the vital industries of any locality or region. The term cannot properly be applied to generalized strikes within single industries. On the other hand, the assertion that there has never been and cannot be a genuine general strike rests on the arbitrary assumption of a completely universal cessation. The vital element in the general strike, whether it involves an entire nation or is restricted to a single locality, is the

more or less complete paralysis of the economic life of that community in order to bring about certain desired ends. These ends determine the classification of the general strikes which have occurred. The general strike may be economic, aimed at the redress of specific injustices in industrial relations, sympathetic in nature and directed at the outset at least against employers. Or it may be invoked as a weapon to wrest some new constitutional right for the working population; in this instance it is directed against the government and is political and reformist in character. Finally, it may be considered the opening wedge in a revolution against the entire established order, in which case it is revolutionary in character. It is obvious that these lines of demarcation are not always clear and may be obliterated in the course of the strike.

The effectiveness of this weapon was realized in the prelude to the French Revolution when Mirabeau warned the privileged classes of his day against irritating "this people which produces everything and which to make itself formidable has only to become motionless." What Mirabeau had in mind was primarily a revolutionary strike, and this was true as well of the publicist Girardin, who in 1851 urged a universal strike against the coup d'état of Louis Napoleon, and of the sociologist Auguste Comte, who a few years later spoke of this weapon of the proletariat "against serious and prolonged violations of the sociocratic order."

It was only, however, with the advent of industrialism that the full force of the general strike as an economic and political weapon was realized. Credit for conscious advocacy of a strike which was something more than a revolutionary demonstration probably belongs to the Chartist pamphleteer and free lance agitator, William Benbow, who in 1832 advanced the idea of a Grand National Holiday or Sacred Month of the working classes for the purpose of reforming society. In 1842 an attempt was made to put this in practise in Richard Pilling's unsuccessful Plug Plot; factory boilers were unplugged and workers "pulled out" in several counties, but the strikers were deserted by the Chartist political leaders.

The congresses of the First International (the International Association of Workingmen) from 1864 to 1872 furnished the first debating ground for the merits of this weapon in the hands of the working class. It was introduced by the English delegation, which advocated its limitation to the economic sphere, and soon became one of the

moot points in the split between anarchists under the leadership of Bakunin, who advocated it as a means of overthrowing the government, and the socialists under the leadership of Marx. From that time on, especially as other types of strikes expanded into organized often nation wide affairs, the concept of the general strike has cropped up in many countries in trade union as well as in political labor circles. It was in connection with a proposed general strike for the eight-hour day in the United States that the fatal Haymarket Riot of 1886 occurred. That event aroused a new interest in the general strike especially in France, where it was enthusiastically included in the program of antiparliamentarian "direct action," and in Belgium, where it was conceived as an instrument for political reform. In the eighties and nineties of the last century it was the French labor movement which most vigorously advocated the general strike in its own federations and in the international labor movement. Curiously enough France is the one important industrial country in which the general strike has never been put into practise. An incipient strike in 1910 was broken under threat of court martial by Premier Aristide Briand, who as a socialist in 1888 and again in 1892 had been responsible for the commitment of the *Fédération Nationale des Syndicats* to the general strike; in 1920 another attempt at a general strike failed miserably. Beginning with the agitation of a worker anarchist, Tortelier, in the eighties, reaching a high point of development in the effective propaganda of Émile Pouget, who was responsible for the acceptance of the general strike in the *Confédération Générale du Travail* in the nineties, the glorification of the general strike reached its final theoretical culmination in the *Réflexions sur la violence* (Paris 1908, 5th ed. 1921; tr. by T. E. Hulme, New York 1912) of Georges Sorel (1847-1922), who believed in the general strike not as an actuality but as a "social myth" and the most significant form of propaganda to keep alive the class struggle.

By the time Sorel's work had appeared the influence of French theory and of actual general strikes, economic, political and revolutionary, in other countries had brought the general strike into the foreground to such an extent that in 1905 it was probably the most vital issue in the labor movement. Belgium had made use of the political strike in 1893 and in 1902 to win universal manhood suffrage from the conservative and Catholic majority in the government. In 1893 the strike had brought out 200,000 work-

ers; in 1902, almost 300,000. Both strikes lasted only about a week; the suddenness of the former resulted in the passage of a bill revising the electorate but not granting unqualified universal suffrage. The second found the authorities fully prepared and adamant. Many workers met death at the hands of the military and the *garde civique*; the Belgian labor movement suffered its first great defeat in twenty years. In Catalonia there had been a revolutionary strike of some magnitude lasting for ten days. In Italy in 1904 over 1,000,000 workers took part in a strike which ended in rioting and violence as a protest against the use of the military in labor disputes. Finally, the revolutionary uprisings of 1905 in Russia had been ushered in by nation wide general strikes; one in January, based ostensibly on industrial grievances but transformed into a revolutionary political strike, resulted in some industrial reforms and some months later in the grant of a popular parliament, or Duma. The later strikes ended in wholesale slaughters, in the loss of the democratically elected Duma and all other ostensible gains. It was this strike movement, however, which led Lenin to give up the antagonism to the general strike which had characterized his views up to 1900.

The discussion of the revolutionary general strike which had come up recurrently in the nineties in the second labor International became a vital issue at the Amsterdam congress of 1904 and clearly marked the division between the extremists and the moderates, between the syndicalists and the parliamentarians. By this time no national lines could be drawn as to the advocacy of the notion: one of its most fervent advocates was Ferdinand Domela Nieuwenhuis of Holland; another was Dr. Raphael Friedeburg, the leader of a new syndicalist group in Germany, the Lokalisten; to the French socialist Hubert Lagardelle it was the simplest and most effective weapon to carry out the class struggle, the advocacy of which was the "yardstick of socialism." In the United States in 1905 William D. Haywood and the newly formed Industrial Workers of the World supported without any very definite program for its execution what Arnold Roller had called the "social general strike." To the politically minded and more conservative leaders, Jean Jaurès in France, Émile Vandervelde in Belgium, Karl Kautsky and August Bebel in Germany and to the majority of the English speaking socialists the revolutionary general strike was a dangerously double edged weapon which "could not fail a single time with-

out involving the whole working class in an immense disaster." They were aware of the usefulness of a threat of the general strike and even advocated its use against some overweening and despotic curtailment of popular rights or on an international scale against the possibility of an outbreak of war. To his persistent belief and outspoken advocacy of an international general strike Jaurès fell a martyr shortly before the beginning of the World War.

Although the 1904 international labor congress rejected the revolutionary strike, the advocacy and practise of the general strike continued. In Germany the Jena congress of 1905 endorsed the strike and later Rosa Luxemburg and Karl Liebknecht, whose father had opposed its use, carried on the agitation for the revolutionary strike. In 1909 the first important economic general strike occurred in Sweden as a protest by the Sveriges Landsorganisation (Swedish National Federation of Labor) against the growing use of the lockout by the powerful employers' associations. This strike, which lasted a full month and brought out 300,000 of the 500,000 industrial workers, ended in the virtual surrender of the workers. It disclosed not only the solidarity of the working class but also the forces with which the government and middle and upper classes would oppose a strike. Local transportation was seriously impeded, but the government's threat of loss of jobs and pensions held the railroadmen at work. Professional men, students, the titled and leisure classes, formed a public security brigade to carry on the most essential services.

In the same year a revolutionary strike broke out again in Catalonia, lasted for six days and was followed by the unconstitutional trial and swift death sentence imposed upon Francisco Ferrer. The Spanish anarchists who fled from Catalonia to the New World exercised considerable influence upon agitation for the general strike, particularly in Argentina, where in 1919 under the direction of the anarchist controlled Federación Obrera Regional Argentina (F. O. R. A.) a strike took place resulting in some economic gains but failing from a revolutionary standpoint and causing hundreds of deaths.

A localized general strike in Dublin in 1913 under the leadership of the syndically minded James Larkin awakened great sympathy throughout Great Britain, especially among that group headed by Tom Mann, who had come under the influence of the I. W. W. in Australia.

It was in 1913 that Belgian labor called its

third great strike for political reform, a proof perhaps that it had by no means taken its previous defeats as final. This time, however, there was a ten-month period of preparation, and 400,000 workers maintained a two-week struggle, in which the only weak point was the failure of the public service workers to respond. The immediate political result was not striking and universal suffrage was not granted until the end of the World War. But the magnitude of the strike, its effective preparation and orderly conduct awakened fear among the middle and upper classes of Europe and encouraged the growth of those citizens' emergency organizations which were called into being in the post-war general strikes.

Immediately prior to the war in 1914 another revolutionary strike took place in Italy, in which Benito Mussolini, then a socialist, played a considerable part. At the close of the World War a wave of sympathy strikes turned Italy into a center of revolutionary disturbances; this was followed by the Fascist reaction and its excesses.

In the turbulent post-war period the most important of the general strikes appeared in countries which had previously had no experience with them—Germany, the United States, Canada, Argentina, China and, finally, almost a hundred years after William Benbow's advocacy, Great Britain.

The influence of the Russian revolution was evident in an abortive revolutionary strike under the leadership of the Spartacist Workers' and Soldiers' Council of Berlin, which heralded the abdication of the emperor and the creation of the German Republic in 1918. The following year the Spartacists again led a revolt and there ensued the strange spectacle of a Socialist government suppressing such strikes through reliance upon officers and soldiers of the old regime. In the resultant reign of terror 1500 men, women and boys were executed in one week in Berlin. It was in this struggle that Rosa Luxemburg and Karl Liebknecht, Germany's two outstanding advocates of the general strike, were put to death. The folly of using such officers and troops showed itself in the monarchistic Kapp *Putsch* of 1920. The Ebert cabinet, which had fled to Stuttgart, met this threat by the proclamation of a general strike for the unusual purpose of saving the existing government. After Kapp's defeat and flight to Sweden the Ebert government ordered the strikers back to work against their will; and although few of the Kappists were punished, strikers who refused to

obey the order were treated as rebel Bolsheviks and many suffered death at the hands of Noske's troops.

In China there occurred in 1925 a general strike which began as an economic strike against certain employers in Shanghai; since, however, these employers were Japanese and Europeans, the strike and the boycott that accompanied and followed it took on a nationalist and antiforeign aspect. Under the leadership of labor federations affiliated with the Kuomintang the strike spread to Canton, Peking, Hongkong and other Chinese cities and lasted for over two months. Although China had often employed the boycott, this first instance of the use of the general strike was interrelated with the rise and development of the factory system, especially under imperialistic and foreign control.

The general strikes of 1919 in Winnipeg, Canada, and in Seattle, Washington, were sympathetic protests against the lowering of standards by employers once the pressure of war shortage was relieved. If the war had resulted in a strengthening of labor forces it had as well demonstrated to citizens' committees and "minutemen" their capacity for action. The six-day Seattle strike and the six-week Winnipeg strike were both hailed as Bolshevik outbursts; but although the American Federation of Labor was undoubtedly opposed to them, as it always had been opposed to the general strike, these strikes were genuine trade union protests and inspired as much by the membership as by the officials. In Winnipeg a citizens' committee of 1000 ran the fire, water and police services; the strike ended in rioting and the arrest and sentence of some of the leaders. Both strikes were remarkably well managed by the unions in the matter of providing commissaries and the like. Outside of movements for general strike demonstrations, however, there is little or no vitality left to the general strike notion in the United States and Canada, especially since the decline of the I. W. W.

The overwhelmingly significant economic general strike was that of May, 1926, in Great Britain. Many threats of a general strike had been made in the years from 1919 to 1921 by the "Triple Alliance" and by the "Council of Action." The final threat ended in the fiasco of "Black Friday." The general strike of May, 1926, was the inevitable outcome of the intentionally provocative strategy of the Conservative cabinet. The Trades Union Congress had threatened a general strike in sympathetic protest against the

national lockout of the coal miners on April 30, 1926, and to the surprise of the leaders of labor this challenge was accepted by the government. Although there was little or no preparation by labor, 3,000,000 workers, representing the vast majority in rail and road transport, in dock and harbor work, in the printing trades and the press and to a lesser degree in the building, iron and steel and heavy chemical industries, obeyed the strike call and for a while completely paralyzed economic life. The government, however, was well prepared for the strike and for emergency transport of foodstuffs by road and rail. The middle and upper classes had organized in the Order for the Maintenance of Supplies (O.M.S.). The navy was extensively used, although absence of press information kept this knowledge from the public. There was much talk by members of the Baldwin cabinet of civil war. The courts were invoked and the Astbury decision of May 11 declared that the strike was illegal.

These measures may have caused consternation but they were not as effective in the breaking of ranks as the conciliatory offices of the more moderate Sir Herbert Samuel, who had been chairman of the 1925 Royal Commission on the Coal Industry and who now came forward with somewhat unofficial offers of settlement of the miners' grievances. The General Council of the Trades Union Congress recommended their acceptance, but the miners refused; and on the following day, May 12, although there was little evidence that the ranks of the strikers were seriously weakened, the General Council called off the strike. The miners remained on strike for months afterward, ultimately yielding piecemeal to the pressure of starvation and complete defeat. The ranks of labor felt themselves badly deserted at the conclusion, and only the rail and transport workers' stubborn refusal to return to work until better terms had been granted prevented the affair from becoming a rout. Nevertheless, in the following year the delegates to a special convention of the Trades Union Congress approved the action of their leaders by a large majority.

The aftermath of the general strike was twofold: a reactionary Trades Disputes Act declaring general strikes illegal was made law in 1927; and an attempt was made by liberal capitalists and the General Council to achieve some practical degree of cooperation between capital and labor, known as the Turner-Mond scheme. Opposition from the more conservative employers' associations nullified their efforts. The actual

cost of the general strike to the government did not exceed \$2,000,000, but the strike and the coal dispute cost the nation \$400,000,000 in revenue and the nation's business over \$2,000,000,000. Trades union funds were very seriously depleted and a vast army of men left on the labor market for months after the strike ended. Save for an amazing sense of labor unity and power during the actual days of the general strike, which perhaps had its reverberation in the Labour government's accession to power in 1929, it is doubtful if the dispute resulted in any gain. It cannot even be claimed that revolutionary fervor has been increased, for despite the rise of certain radical leaders to power the strike was marked by its lack of revolutionary spirit and its insistence on the economic and social ends.

From this partial account it is obvious that general strikes have been called in many countries by varied groups and under varying circumstances. Trade unionists, moderate socialists, syndicalists and communists have alike resorted to the instrument, either as a defensive or an aggressive measure. The strikes have ranged in length from the three-day strike in Italy in 1914 to the two-month Chinese strike. There has been a wide variety of opinion among leaders as to preparation and strategy. The advocates of economic and political strikes have stressed the necessity for careful planning on the part of the leadership; to revolutionists like Trotsky and Luxemburg, on the other hand, the only effective general strike was one which was not the product of long organization and the arbitrary fiat of leaders but one in which the revolutionary energy of the ranks of labor provided the real motive force. The original advocates of the general strike realized the oppressive powers of government but could not foresee the resourcefulness which capitalistic industrialism provides. As the use of road and air transport increases; as the radio provides a substitute for the telephone, telegraph and mail; as the professional and leisured classes are organized into citizens' committees not only of a generalized type but highly specialized, like the Technische Nothilfe of Germany, the inevitable revolutionary logic of the general strike will no doubt have to be frankly faced by its advocates. The success of the revolutionary strike in Europe has been shown to be partially dependent at least on the spirit of revolt in the military, naval and police forces; the existence of such a spirit in western nations is highly doubtful. Despite all these reasons and the record of failure in the past the

weapon is hardly likely to be disregarded when in moments of desperate protest the workers feel that other avenues of appeal have been deliberately blocked or destroyed.

GENEVA CONVENTION. *See* RED CROSS.

GENIUS. Genius was the counterpart in the ancient Italian religions of the Greek *daimon* to which Socrates acknowledged indebtedness for help in difficulties. It was at first thought of as the godlike personification of the procreative power in man; every man had a genius and every woman a Juno. Later it came to be regarded as a guardian spirit intermediate in character between the gods and men, accompanying every man from birth until death and helping determine his destiny. There gradually developed the notion that whenever a person showed a marked deviation from the average in personality or ability some spirit was speaking or acting through him. Throughout the Middle Ages this belief colored all thinking upon the question of exceptional power of any kind. Among many primitive peoples there is essentially the same attitude. The Plains Indians' search for visions, for example, was largely concerned with obtaining the personal favor of a guardian spirit, which would thereafter protect and guide the individual. The able and successful person, whether warrior or medicine man, ascribed his success and power to the favor of the guardian spirit. In modern times the word genius refers to the manifestation of the highest and rarest form of creative ability. In popular thinking, however, it is by no means free from mythological and religious connotations, as is indicated by such phrases as "a divine

spark," "divine fire" and "working as if possessed." Most people do not go quite so far as the Comtists in their deification of great men, but they are often reverent and almost religious in their attitude toward them and they erect monuments to them after their death.

Francis Galton applied the statistical technique of the probability curve to the study of genius and regarded the differences in human abilities from the idiot to the great man as deviations from the average ability. He regarded eminence as due to ability which differs in amount but not in kind from the ability of the average man. Léon Paschal, who also conceives genius to consist solely of superior ability, holds it to be the property of developing mentally in a constant fashion beyond adolescence, which he regards as the threshold of decline in average people. Others have devised the theory that genius is closely related to some form of insanity or mental degeneration. Moreau de Tours believed genius to be a development of certain types of idiocy. Lombroso concluded on the basis of rich but artificially selected material that genius was a degenerative psychosis of the epileptoid group. Much of the subsequent literature has concerned itself with disproving Lombroso's thesis. On the basis of his study of British genius Havelock Ellis has shown that since the association of genius with insanity occurs demonstrably in less than one out of twenty cases, all theories as to genius being a form of insanity must be discarded. Kretschmer points out, however, that psychopathic border line cases are definitely more common among men of genius than among ordinary men and holds that psychopathy tends toward creativeness because the psychopathic person, unadapted to his environment and hence uncomfortable in it, resists it and attempts to alter it by doing great things. He considers genius a rare and extreme variation of the human species biologically and as such possessing little stability. Lange-Eichbaum also emphasizes the psychopathic as opposed to the psychotic aspects of genius. He believes that the psychopathic constitution favors the development of genius because the intense and powerful affectivity with which it is accompanied results in experiences which others do not have; it causes suffering and pain and leads on to dream and phantasy which stimulate achievement. Related to the explanation of genius in terms of psychopathology is the judgment of Jeannette Marks and others who find in drugs and intoxicants the drive toward the crea-

tion of genius. The psychological concomitants of tuberculosis are also thought by Marks and A. C. Jacobson to play an important part in the making of genius.

Freudians have attempted to explain the creations of the artistic and even of the practical genius as the sublimation of unsatisfied wishes. They regard the artist as maladapted and dissatisfied, creating art as a "surrogate form of life." Otto Rank believes that the artist, occupying a position between the dreamer and the neurotic, is enabled to become an artist because he possesses will power which others lack. Case studies of genius by psychoanalysts illuminate the tenuous nature of their underlying hypothesis that the Oedipus complex furnishes the drive toward the creations of genius. According to Max Graf, Richard Wagner's Flying Dutchman fled back to the land in search of the one true motherly heart, and when he found her he entered at last into rest; similarly Wagner strove to find his rest in the refuge of motherly arms and boyish phantasy. Ludwig Jekels considered Napoleon's ambition to rule the whole world to have been an expression of his wish to be in full possession of his mother—Mother Earth. Alice Sperber interpreted Dante's failure to rebel against the authority of the church as due to the fact that his own mild and non-interfering father aroused no revolt in him; his interest in another world arose from his desire to find the lost objects of his affection—his mother and Beatrice. To explain the creations of philosophy Alexander Herzberg makes use of the concept of sublimation of non-sexual as well as of sexual impulses. He considers philosophizing to be the satisfaction of an impulse by means of an alternative to action and idealistic philosophy to be the result of an unconscious tendency to depreciate or even annihilate the external world. Diametrically opposed is Türck's view that genius, to create anything worth while, must keep in mind the laws of the real and the objective and must not lose itself in arbitrary phantasy creation.

The psychologists who accept the standpoint of Alfred Adler rather than that of Freud find the source of a great deal of significant achievement in the mechanism of compensation for a real or fancied inferiority. They suggest, for example, that Demosthenes became the greatest orator of his time by reason of his overcompensation for his speech defect; Beethoven a success as a musician because of his defects in hearing, which early focused his interest on auditory

experiences and provoked a process of intensive training. The Adlerians do not attribute artistic achievement only to compensation for a specific defect, but they appear to regard this as the most important single factor in genius.

Undoubtedly unconscious activity plays an important part in artistic creations, but it is difficult to use the concept of the unconscious with any accuracy. In Jung's concepts of a "racial unconscious" and differences between racial unconsciousnesses the concept takes on certain highly speculative and almost mystical connotations. The unconscious also forms the basis of Mary Austin's theory of genius, although she prefers a somewhat different terminology.

The quantity and the quality of men of genius have often been attributed to their race. Galton, for example, asserted that the average ability of the Athenians between 530 and 430 B.C. was, on the lowest possible estimate, very nearly two grades higher than that of the modern British, whose average ability is in turn two grades higher than that of the African Negro. Inasmuch, however, as the evaluation of genius or creative ability varies greatly with time, culture and the judgments and standards of the group, it is hardly scientific to utilize Galton's criteria of eminence in measuring African Negroes or Athenians. Gobineau, Chamberlain and more particularly Woltmann have expended considerable ingenuity in an unsuccessful effort to prove that one particular race, sometimes called Aryan, sometimes Nordic, was responsible for most if not all truly creative activity.

The relative part played by heredity and environmental opportunity in the creation of genius has been the subject of extensive controversy. Evidence that eminent men tend to have eminent children led Galton to contend that genius was inherited. He failed to take adequate cognizance of the fact that in the families studied the environment was also superior. Lester Ward was particularly active in stressing the role of the environment in determining achievement, arguing especially on the basis of Odin's evidence that economic status and the availability of cultural opportunities in the place of residence were decisive conditioning factors. Cattell's study of American men of science showed that the professional classes contributed fourteen times as many scientists as did other groups and that the agricultural class contributed only one half as many scientists as did the manufacturing and trading classes. R. H. Holmes found that cities in the United States have been more than twice

as productive of individuals of eminence as the rural districts and that the cities' ratio of productivity has declined with the improvement in the means of communication and of rural education. Place of residence and occupation of parents were also shown by S. S. Visser's statistical study of notables in the United States to be determining factors in achievement. On the other hand, there are undoubtedly differences in ability between individuals and families; but that heredity is never entirely predictable is shown by Jennings, who contends that, while biologically superior parents appear to have a better chance than others of having superior offspring, by a fortunate combination of genes biologically inferior parents may produce geniuses. Genius cannot be ascribed exclusively either to heredity or environment, to nature or to nurture; it is the complex product of the interaction of these forces. The absence of requisite factors in the economic and cultural environment, however, inhibits the development of native ability.

Recently attempts have been made by Terman and his collaborators and by Leta S. Stetter Holmgren to understand the creative ability of the genius by applying the methods of modern genetic psychology, more particularly by studying gifted children who rank very high in intelligence tests. In the Terman study children with an intelligence quotient above 140 in the case of younger children and above 132 in the case of the older ones were included in the gifted group. These children came mostly from homes of high social status; a large proportion were of English, German, Scotch and Jewish parentage and there was a somewhat larger proportion of boys than of girls, although the three children who scored highest were girls. In general it was found that gifted children tended to be tall, heavy and well nourished, strong and swift, above the average in desirable character traits and nervous stability and rarely neurotic. This is in direct contrast with Havelock Ellis' statement that there is a tendency for children who become geniuses to be of feeble health and Kretschmer's view that if the psychopathic factor, "the ferment of demonic unrest and psychic tension," be taken away from the constitution of the genius nothing but an ordinary gifted man would remain. The fact that the groups studied are by no means comparable makes it difficult to determine the degree of contradiction between these judgments. Terman's group of superior children is not so highly selected as

the groups of adult geniuses studied by other investigators; and, as Terman acknowledges, the later success of the children studied will depend upon factors other than the intelligence quotients and may be determined by chance combinations of personal merits and environmental circumstances. The question further arises as to what relation exists between the kind of ability possessed by the genius and the kind of ability demonstrated by intelligence tests. While tests have practical value in educational psychology, what they actually test and the intercorrelation of the various abilities which enter into the performance are still uncertain. There is considerable evidence for the view that "general intelligence" is not so "general" as was formerly believed and that the scores on the intelligence tests are determined by whatever specific abilities are being tested. There is no reason to believe therefore that the kind of specific ability possessed by a Bismarck or a Michelangelo or a Beethoven would be correlated in any way with an intelligence quotient. Studies of the characteristics of gifted children might then have nothing to do with the often one-sided but remarkable development of the genius. In view of the difficulty of knowing what an intelligence quotient signifies even when it has been obtained under the best possible conditions attempts such as that of Terman's collaborator, Catherine M. Cox, to arrive at an estimate of the intelligence quotients of great men are misapplications of the quantitative method.

If one assumes that a high intelligence quotient and ability which manifests itself in later life are related, there is a discrepancy between Terman's results on the proportion of the sexes among the gifted children—111 boys to 100 girls—and the relatively rare incidence of women geniuses in history, as noted especially by Lombroso and Ellis. Differences in education, in training for a career, in family cares, in cultural values for men and for women, help to explain the variation in achievement of the sexes.

GENOVESI, ANTONIO (1712-69), Italian abbot, philosopher and economist. Genovesi taught metaphysics at the University of Naples but soon turned his attention to economics. When in 1754 the first chair of commerce in Europe was instituted at the University of Naples, through the generosity of the Tuscan Bartolomeo Intieri, Genovesi was called to occupy it. His economic ideas aroused wide interest but they were hardly original; a free trader at heart, he nevertheless inclined for political reasons to a moderate protectionism. The basis of all economy, according to Genovesi, is agriculture; minerals, fisheries and the like follow in importance. The best means of promoting agriculture is to remove every obstacle to the increase and welfare of the population, every fetter upon the internal circulation of its products, and to reduce as far as possible the number of those who do not produce and who interfere with those who do. Industry he would keep within strict bounds, as its disproportionate development would undermine agriculture, about which he was chiefly

solicitous. He distinguished between useful commerce which exported finished goods and caused the importation of raw material, and harmful commerce which exported raw material and imported finished products; the former should be left free, the latter should be subject to the strictest regulation. Genovesi viewed with disfavor the imposition of treaties of commerce upon "nations that have neither maritime trade nor navigation" and "wish to be open and accessible to all nations." Here as in all his economic thinking he had in view the peculiar conditions of the Kingdom of Naples, which distinguished his ideas from the generalizations of the physiocrats. In his conception of the state Genovesi followed Giannone. Starting from the principle that there can be no well ordered state where there are more than one authority and more than one law, Genovesi was impelled to deplore that schism between the civil and the religious conscience which the polity of the Roman church had introduced into the very lives of the people. Within the church he favored a limitation of the papal power over the bishops and a return of the church to its purely spiritual functions thus dispensing with legal authority and with coercive power.

GUIDO DE RUGGIERO

Works: Elementorum artis logico-criticae (Naples 1745, new ed. Bassano 1794); *Elementa metaphysicae*, 5 vols. (Naples 1743-45; new ed. with title *Disciplinarum metaphysicarum elementa*, Bassano 1785); *Trattato di scienze metafisiche per gli giovanetti* (Naples 1766, 2nd ed. Venice 1782). His chief philosophical and economic writings are collected in *Biblioteca dell' economista*, 1st ser., vol. iii (Turin 1852), and some additional political writings have been published for the first time in Monti, G. M., *Due grandi riformatori del settecento: Antonio Genovese e G. M. Galanti* (Florence 1926) chs. i-ii.

GENS. *See* SOCIAL ORGANIZATION.

GENTILI, ALBERICO (1552-1608), Italian jurist. Gentili, a Protestant, was forced by religious persecution to seek refuge in 1580 in England, where in 1587 he became regius professor

of civil law at Oxford. He also practised in London in the Admiralty Court. In 1584 he advised Elizabeth's government with reference to the plot of the Spanish ambassador, Mendoza, to depose the queen and as a result was led to write his *De legationibus* (London 1585), in which he insisted that the public character of ambassadors was limited within the states to which they were accredited; that rebels had no right to an ambassador unless their strength was equal to that of their government; that difference in religion between states did not involve any modification of general diplomatic practise; and that the contracts of diplomats and their entourage concluded during an embassy were proper subject matter for the local jurisdiction. This work gave Gentili a great reputation and influence and did much to formulate and establish the principles and practise of modern diplomacy. In his *De jure belli libri tres* (Hanau 1598; ed. by T. E. Holland, Oxford 1877) he asserted that war should be the subject of laws and that such laws were naturally, and must always be, founded on right reason and consent. Although this work was soon eclipsed by the *De jure belli ac pacis* of Grotius, the first and third books of which were based upon Gentili's earlier work, nevertheless Gentili is entitled to rank as a founder of modern international law. Grotius' *Mare liberum* also owes a great debt to Gentili's work. In 1613, as a defense of Spanish and English claims against those of the *Mare liberum*, Gentili's posthumous *Hispanicae advocacionis* (Hanau 1613) appeared, the earliest published reports of judicial decisions on maritime law, consisting of pleadings and decisions in cases in the Admiralty Court in London, in which the legality of the capture of Spanish vessels by the Dutch was considered. Gentili was engaged in these cases as advocate of Spain, an office to which he had been appointed in 1605.

(New York 1921) vol. i, p. 112-212; and the introduction by Ernest Nys, published in the edition of the *De legationibus* in the same series, no. xii, 2 vols. (New York 1924) vol. ii, p. 92-372.

GENTLEMAN, THEORY OF THE. The term gentleman is English, so English that it is taken over unchanged into other languages to express the many vague concepts which it covers. Continentals distinguish these concepts specifically. The Italian *signore* must be rendered as gentleman, but it connotes wealth. Its abstract derivative, *signorilità*, denotes splendor, lavishness. The old Provençal *senhoril* connoted pride. The French *gentilhomme* denotes birth, as does the Italian *gentiluomo*—for them to denote breeding, an adjective must be added. The *honnête homme* of the old regime had birth and manners. In the United States not so long ago a gentleman in the language of vital statistics was a person living on income without practising a trade or profession—the *rentier* in French and German; in Italian *possidente*, meaning owner. The language of courtesy shows similar shadings and specifications.

The concepts that may be severally detected in the complex of notions embraced under the word gentleman belong to all historic times and peoples. The sentiments which they express vary in intensity and in their relative importance to one another. One fundamental characteristic nevertheless accompanies them in all times and places: they are sentiments of combat; they are concepts of social competition. In modern democratic times there is a tendency to think of the gentleman in terms increasingly ethical and for four centuries theorists of the genteel have done their best to confuse the gentleman with the ideal man. Montesquieu almost alone in his time was courageous enough to contrast the gentleman's morality with the plain man's morality and to locate the concept of gentility in the sphere of social struggle (*Esprit des lois*, bk. iv, ch. ii).

The gentleman must be well born. The Germans concede birth in a term of bourgeois courtesy: *hochwohlgeboren*. Gentle itself derives from the Latin *gens* and historically has been colored by patriarchal feudalism, particularly that of France. The old Provençal adjective *gents*, meaning pretty or nice, was derived from the Latin genitive *gentis*: of family, of breeding. The test of gentility in feudal Europe is the right to a coat of arms; therefore once a gentleman always a gentleman. The point is reluctantly conceded by Peacham (*Compleat Gentleman*, 1622), who laments that drinking, swearing and wenching were no bar to recognition at the English court. Factors conditioning the importance of birth are property, occupation and descent in time. Under

feudalism privilege had a legal basis in property deed. The general principle was formulated in positive law under the Venetian Republic, which admitted to its "originary citizenship" only families which had lived for three generations on income. The sentiments corresponding to concepts of birth are more intense in more remote periods of history, especially with reference to primogeniture. In Græco-Roman civilization the family, according to Fustel de Coulanges, had a mystical status and was fortified by tabus. An exaggeration of the same sentiments appears in Hindu concepts of caste and in European concepts of royalty. Castiglione, the most celebrated of the older theorists of the genteel, regarded "quality" as physically hereditary and cited analogies from horse breeding and plant culture. Goldoni's comedy exploits the notion that a noble waif reared by peasants will instinctively play at war; a peasant waif reared by nobles, at menial tasks. The prestige of birth is acquired in three generations by wealth or achievement leading to exemption from gainful labor; it is lost by returning to gainful labor. In modern democratic countries the distinction conferred by birth is less than that of achievement and good manners but it has held its own as compared with wealth.

Wealth is the eternal disillusionment of the parvenu. Historically a de facto attribute of gentility, it does not constitute or confer gentility. "Riches," says Peacham, "are an ornament, not the cause of Nobility." The relationship between wealth and gentility is one of interdependence: the characteristic life of the gentleman is impossible apart from wealth, which in its turn enables those whom Castiglione designated as ignoble to acquire the arts and in time the status of gentility. Gentility replenishes its ever depleting ranks from wealth at a price which has not varied greatly in the course of centuries. The old Venetian nobility could be bought for 100,000 ducats, the ducat being roughly worth a pound sterling; a very respectable patent can be had by a gentleman for that price today. Wealth is in general powerless to acquire gentility apart from breeding. Wealth conjoined with birth tends as an objective fact to produce power. But that power is not a requisite for gentility is shown by the French Revolution, where an aristocracy was swept from power only to gain in social prestige. Henry IV of France was slighted as an upstart by the gentlemen of his court. The present day gentleman's scorn for political power is not new. Bureaucra-

cies have always been peopled from the bourgeoisie. It is again a relation of interdependence. The gentleman must have access to power, and to lose such access means in the long run loss of caste. Power apart from birth, wealth and breeding has readier access to gentility than has wealth, although the recognition may halt at externals: Marie Louise will marry Napoleon, but she will twit him in private.

Achievement, distinguished ability, notable public service, have ever been roads to the acquisition of gentility. With singular obtuseness Castiglione in his *Cortegiano* (1528) regards gentility as the cause of achievement. Theorists of the genteel as a rule are only too willing to see the real point. Achievement, however, has always been subject to good manners, and it must lead to wealth; otherwise the genteel status is ephemeral. The feudal system provided for such permanency by gifts of land and title. The English baronetcy, without inheritance of title, shows the precarious status of achievement alone.

No gentleman works—and one must add—for a living. The theory has been elaborated by Veblen in his *Theory of the Leisure Class* from the point of view of economic determinism—a basis far too narrow. The sentiments attaching to occupation are very violent and increase in intensity in earlier historical periods. The tabus arrange themselves in a symmetrical scale. All through historic times menial labor has been a bar to gentility, and with few and transitory exceptions manual labor also. Zimmern in his *Greek Commonwealth* outlines a primitive Greek community where artisanship was held in high esteem. There was a moment in Florentine history when membership in the trade guilds was forced on the Ghibelline nobility. For such cases the acute remark of Peacham on the mercantile nobility of Venice serves: if such people were gentlemen at home, they were not so regarded abroad. In modern democracies the political equality accorded manual labor only intensifies sentiments of social inequality. In Venice and Rome disqualifications of artisanship were explicit in positive law. In Grecian Thebes there was a law denying citizenship to anyone who had practised a trade within ten years. The tabu on manual labor has at times a superstitious intensity. The comte de Saint-Simon relates that the nobles of Louis XIV in camp before Lille preferred to go hungry rather than lift bags of rice from their wagons. The taint of labor descends from grandfather to grandson. The sentiments work from below upward as well as from above

down, as is illustrated by Princess Wolkowski's account of losing caste with her peasants in Russia in 1916 by personally cultivating her roses.

Peacham is puzzled by the fact that advocates and physicians are barred from gentility although those callings are "not servile but honorable, noble and free." The mystery yields to Veblen's principle of gainful employment. No profession is genteel when it is practised for a living. Salaried clientage for historical reasons is more genteel than free professional practise. Employees of institutions are more genteel than free lances. The same principle explains the case of the actor and actress; the argument of presumptive sexual immorality usually brought against the actor's profession is an afterthought—immorality has never been a bar to gentility. The line drawn by Peacham between the physician and the surgeon might seem explainable in the fact that the surgeon of his day was a barber, were it not that a similar line today separates the physician from the dentist. The surgeon and the dentist work with their hands. The surgeon, however, has recently been redeemed. The tabu on undertakers and executioners involves this element—regarded rationally, as de Maistre points out of "Monsieur de Paris," both would seem to be solemn, half sacred functionaries—although the sentiments regarding gainful employment are complicated in their cases by powerful tabus connected with corpses, death and bad luck.

The tabu on gainful employment is exemplified in almost pure form in discriminations against the merchant. Merchants were completely barred from feudal and ancient gentility; according to Fustel de Coulanges the Roman reaction could be violent. The mercantile taint could, however, be removed in two generations instead of three and was attenuated by good manners. In modern democracies there is a tendency to regard wealth resulting from business activity as achievement.

Castiglione in particular, but older theorists of the genteel in general, stress the exercise of arms and expertness in dueling as the characteristic pursuit of the gentleman. The situation has been analyzed anthropologically by Veblen. Even in modern democracies a military commission, down to the grade of lieutenant, is regarded as of itself conferring distinction. In monarchical countries tradition, if not law, requires that army and naval officers be of gentle birth for at least two generations.

In the West the gentlemanly professions have been the military, diplomacy and the church

down to the grade of vicar. The priest is not a gentleman—in Europe the class struggle within the clergy often rages violently. As for the "intellectual," so-called—literature has noble genres, such as epic, tragedy and oratory; and "ignoble" genres, such as the tale, the farce and the novel. The novel has become genteel under English influence since the eighteenth century. Cultivation of the noble genres has consistently been held genteel, although in the days of feudalism a knight regarded it as effeminate, as "clerical," to know how to read and write. Literature has been associated with money making only in very recent times—Voltaire was one of the first to organize and financially exploit circulation. The gentleman of olden days shrank from publication as a form of bad manners and got into print only through the "treason" of some friend or "theft" by some printer. The painter, the sculptor and the architect were redeemed by the Italian Renaissance and largely through the admiration accorded them by men of letters. Leonardo was still regarded as a boss draftsman, and Castiglione alluded to him contemptuously as a dilettante. Michelangelo was one of the first painters and architects to win social recognition. In contemporary Europe literature and the arts are roads to gentility on a basis of achievement, but unaccompanied by birth they remain in a status of clientage. The teacher has never been a gentleman—he works for money and in times past he was usually a priest. Since the teaching profession, like the priesthood, is exempt from manual labor, it can contribute to the prestige of birth—the priest may make a gentleman of his nephew, the teacher of his son.

For four hundred years the western world has assiduously cultivated the theory and the art of manners. Today manners are an essential attribute of the gentleman. Absence of them will invalidate wealth and achievement and mitigate sentiments attaching to birth and power. The theory of manners has been consistently confused by the introduction of an altruistic element, as, for example, in the definition of manners as consideration for others. Manners are exquisitely practical and combative, a fact which tends to be more explicit with the older theorists. In France in 1640 Faret formulated the rules for politely slighting inferiors. Castiglione frankly recognized self-assertion as the right, nay duty, of the gentleman and elaborated a technique of Machiavellian modesty. The considerateness of the gentleman is a chivalric compromise based on the principle of reprisals: one accords recog-

dition in exchange for recognition. Manners are often erroneously regarded as deliberate devices for asserting quality. Undoubtedly manners have been purified and perfected by study and criticism in a process somewhat similar to the purifying and perfecting of grammar and language. The material data, however, are supplied not by invention but, as Pareto has shown, by historic forces not directly comprehended by the gentleman, who eats with his fork because gentlemen eat with forks: he does not know why.

A fundamental distinction between ancient and oriental manners and modern western manners lies, as is demonstrated by Crane, in the presence of women in modern western society and their absence from pagan and oriental societies. From the twelfth century to the present the role of women in society proper in the West has steadily increased in importance and since the seventeenth century has been virtually dominant—the “indirect” influence of woman on affairs so dear to modern antifeminists. The promiscuous contact of men and women in society has presupposed an increasingly strict regulation of sex impulses and on the theoretical side has produced recurrent chivalries and Platonisms. Overt manifestations of sex disappeared from Italian society early in the sixteenth century and from French and English society in the seventeenth century. The gentleman is, however, by definition sovereign and above restraints, and aristocracies have in historic times been consistently licentious. Moralities are unredeemably bourgeois; and there are peasantries which enforce the single standard set for the women also upon men, as in Sicily, Yugoslavia and Albania. In general the plain man distinguishes morality from immorality; the gentleman distinguishes between immorality and scandal.

Castiglione distinguished neatly between the *bon compagnon* and the gentleman. Boisterousness and noisy gaiety have been progressively eliminated from the genteel since the days of the Hôtel de Rambouillet in France and the process reached its climax in English Victorian sedateness and dullness.

The definition of the genteel as the art of pleasing attained its maximum application in the French seventeenth century; but it is a universal trend. Taine in his *Ancien régime* correlates with this definition the tendency in the language of elegance to eschew the physical and the concrete in favor of the euphemistic and the abstract. Reluctance to mention certain parts of the body, such as the belly and legs, dates only from the

seventeenth century. The transition in time is abrupt: there is a gulf between Rabelais and the French *précieux* in this respect. Reticence on physical matters was unknown to the Middle Ages and the ancients. Hygiene is a very modern preoccupation of the gentleman; the obligation of bodily cleanliness does not antedate the nineteenth century, although it was characteristic of the gentleman in the heyday of Græco-Roman civilization. Language is one of the manifestations of group uniformities—hence the various non-rational purisms which genteel grammarians are always ethicalizing with numberless rationalizations. A fact recurrent in history is the growth of a polite or literary language paralleling an ordinary speech. The question as to why familiar language displeases in a printed book has puzzled theorists of the genteel. Castiglione suggested that it is due to the permanence of the printed word. More probably it depends on the fact that a book establishes a formal, not an intimate, relation between author and reader. The observance of fashion in dress is likewise determined by the pressure of group uniformity, but it is also associated with powerful sentiments of competition. So cogent are sentiments attaching to display in dress that aristocracies have often been obliged to resort to sumptuary laws as measures of self-preservation. Sentiments attaching to abode are almost as violent. Housing regulations are enforced with special ruthlessness in the Soviet Union as a direct and immediate way of abolishing distinctions of class. Moralists have contended that “the clothes do not make the man.” They do, however, make the gentleman; and although those same moralists praise the toiler’s cot they wisely adorn Heaven with gold and jasper.

The ethics of the gentleman are ethics of combat, of competition in a struggle for eminence and distinction and are therefore antithetical to humility, self-effacement, altruism and abnegation. Simplicity and inconspicuousness are practised in plutocratic democracies but as measures of aloofness and exclusiveness—publicity being for “climbers” only. The gentleman’s ideal is not virtue but honor, as Montesquieu remarked; whatever is honorific will in the end be held virtuous in the gentleman. In general the test of the gentleman is his superiority to external controls, especially the physical, moral and sentimental limitations that determine mediocrity. The ethic of the gentleman in all times and places is Nietzschean, not Christian. Noteworthy among genteel superiorities is the superiority to

sentiment—a tendency that according to Taine reached a maximum intensity in the impersonality of French manners under Louis XIV. Honor being the supreme virtue of the gentleman, ridicule, in the French sense, quite as much as dishonor is the unpardonable sin. The gentleman may be a hero, but not a martyr. "In Things indifferent," said George Washington in his *Rules of Civility*, "be of the Major Side." Gentlemen may espouse minorities as a matter of conscience, but the minority must never be small enough to count as queer or eccentric. The Earl of Pembroke joined the Quakers of John Fox—but, says a contemporary, "he soon withdrew." The ethic of the gentleman is a technique of prestige and prestige means good standing with majorities.

GENTZ, FRIEDRICH VON (1764–1832), German publicist and statesman. As a disciple of Kant, Gentz was at first enthusiastic about the French Revolution, but he later came to oppose both Jacobin radicalism and Napoleonic imperialism. He was the most effective continental advocate of the English system of balances in

both domestic and foreign affairs. It was at Gentz's suggestion that Christian Garve in 1794 made the first adequate German translation of Adam Smith's *Wealth of Nations*, and Gentz's own translation and commentary on Edmund Burke's *Reflections on the French Revolution* (1793) became the principal crystallization point for conservative and historical thought in Germany. In 1795 he founded the *Neue deutsche Monatsschrift* in Berlin and in 1799 the *Historische Journal*, which demanded that Prussia enter the coalition against France. In 1802 Austria obtained the services of this most talented of German publicists, since his position as an official in Berlin had become impossible politically. In very close personal contact with London, acting from conviction and unshaken by all vicissitudes, Gentz remained the center of agitation for resistance against the French until Napoleon's downfall. Among his numerous writings on politics the *Fragmente aus der neuesten Geschichte des politischen Gleichgewichtes in Europa* (1806) is of the greatest importance.

Gentz early recognized Metternich's brilliant diplomatic abilities and from 1812 until his death cooperated with him in the pacification of Germany and Europe. He acted as secretary of all the European congresses from Vienna to Verona and every document of the Vienna chancellery passed through his hands. He gave the diplomacy of the congress period its classic style. He differs from Metternich in his dynamic conception of the idea of balance of power. The quintessence of his thinking is a methodology based on Kant which kept him from the reactionary political romanticism of his disciple Adam Müller as well as from the liberal romanticism of his friend Wilhelm von Humboldt. Although his character has been disputed violently by Bonapartists, Prussian-German nationalists and radicals, a profounder understanding of Gentz from the standpoint of Europe as a whole has been growing since the publication of Heinrich von Srbik's *Metternich* (2 vols., Munich 1925).

GEOGRAPHY

CULTURAL.....	CARL SAUER
HUMAN	CAMILLE VALLAUX
ECONOMIC.....	KARL SAPPER

CULTURAL. In the past century the geographers have been dislodged from their earlier care free encyclopaedic state, in which they discriminated only in terms of personal interest and made camp wherever the prospect pleased. The scientific tendencies of the time have brought external criticisms and internal compulsions and a large methodologic literature which marks the process of intrenchment within a recognizable realm. The earlier volumes of the *Geographische Jahrbücher* (Gotha 1866-), especially the articles by H. Wagner, are much concerned with question of objective and method. The most comprehensive epistemology is Alfred Hettner's *Die Geographie: ihre Geschichte, ihr Wesen und ihre Methoden* (Breslau 1927). In these discussions essential unity has not been attained, and to this day there are irreconcilable camps. Therefore the question as to what geography is must continue to be asked, because the answer determines the premises under which the data have been assembled.

Geography is approached in various ways and to various ends. On the one hand, there is an attempt to find the limitation of study in a particular causal relationship between man and nature; on the other, the effort is to define the material of observation. This cleavage has attained increasing dimensions year by year and threatens perhaps to form a gulf across which no community of interests may be maintained. The situation dates from the beginning of modern geography but has grown acute only in the present century. The one group asserts directly its major interests in man; that is, in the relationship of man to his environment, usually in the sense of adaptation of man to physical environment. The other group, if geographers may be divided into two simple classifications, directs its attention to those elements of material culture that give character to area. For purposes of convenience the first position may be called that of human geography, the second that of cultural geography. The terms are in use in this manner, although not exclusively so.

Karl Ritter, holder of the first academic chair in geography, especially emphasized human

activity as physically conditioned. The thesis of the environment that molds civilization is of course very old but received especial attention from the rationalism of the eighteenth century and found able spokesmen in Herder, Montesquieu and later in Buckle. Ritter's position was vigorously attacked by Froebel and Peschel as impressionistic and unscientific. Even around the middle of the last century there existed a polemic literature concerning the physical environment as the field of geographic study.

Friedrich Ratzel in his *Anthropogeographie* (2 vols., Stuttgart 1882-91; 2nd ed. 1899-1912) outlined the framework in which human geography in the narrower sense has moved since that time, a set of categories of the environment—ranging from abstract concepts of position and space to climate and seacoasts—and their influence on man. By this one work he became the great apostle of environmentalism, and his followers have largely overlooked his later cultural studies, in which he concerned himself with movements of population, conditions of human settlement and the diffusion of culture by major routes of communication. The effect of Ratzel's environmental categories was not great in his own country; in France it was tempered by Vidal de la Blache's acute substitution of *possibilisme* for the original determinism; but in England and the United States the study of the physical environment as the goal of geography became well nigh the mark of recognition of the geographer. Apparently Ratzel did not regard his *Anthropogeographie* as anything more than a stimulus and an introduction to a human geography that was to be based on a study of culture. Whereas anthropologists have made large use of his analysis of the diffusion of culture, western geographers think of him only as an environmentalist. In the United States the *Annals* of the Association of American Geographers (published in Albany since 1911) show the rapid spread of human geography. So far the high point of this invasion has been marked by H. H. Barrows' "Geography as Human Ecology" (in *Annals*, vol. xiii, 1923, p. 1-14), the presidential address before that body in 1923, a frank plea to

constitute the subject solely on the basis of environmental adjustment. So prevalent has this view become in English speaking lands and so different is the objective of the continental body of geographers that the work done by the one group is largely ignored by the other.

The rejection of the environmentalist position in geography is based not on any denial of the importance of studies in environment but simply on the following methodological grounds: (1) no field of science is expressed by a particular causal relation; (2) the environmentalist inquiry lacks a class of data as field of study, there being no selection of phenomena but only one of relations, and a science that has no category of objects for study can lead, in Hettner's words, only a "parasitic existence"; (3) nor is it saved by a method that it can claim as its own; (4) special pleading is most difficult to avoid by reason of the fact that success lies most apparently or at least most easily in the demonstration of an environmental adjustment. Theoretically the last objection is least serious; practically it has been most so, as is illustrated by a flood of easy rationalizations that certain institutions are the result of certain environmental conditions. In this regard those students who have least troubled themselves with knowledge have reaped the greatest apparent successes. The polemic against the position of geography as the study of environmental relations has received its sharpest definition by Schlüter, Michotte and Febvre.

The other school continues the major tradition of the subject. It therefore does not claim that it represents a new science but rather that it attempts the cultivation of an old field in terms acceptable to its age. It is not anthropocentric; rather has it shown at times excessive tendencies in the other direction. Cultural geography is only a chapter in the larger geography and always the last chapter. The line of succession passes from Alexander von Humboldt through Oskar Peschel and Ferdinand von Richthofen to the present continental geographers. It proceeds from a description of the features of the earth's surface by an analysis of their genesis to a comparative classification of regions. Since the day of Richthofen it has been customary also to use the term "chorology," the science of regions. During the latter half of the past century the work carried on was overwhelmingly physical, or geomorphologic, not because most geographers thought that the study of the genesis of physical land forms exhausted the field but because it was necessary to develop first a

discipline to which the physical differentiation of the earth's surface would yield. Geographers are now in possession of a method by which the origin and the grouping of physical areas can be determined and in which successive steps in their development are identified. Processes have been identified, measures of the intensity and duration of their activity have been determined, and the grouping of land forms into assemblages which constitute unit areas that can be genetically compared is well advanced.

The latest agent to modify the earth's surface is man. Man must be regarded directly as a geomorphologic agent, for he has increasingly altered the conditions of denudation and aggradation of the earth's surface; and many an error has crept into physical geography because it was not sufficiently recognized that the major processes of physical sculpturing of the earth cannot be safely inferred from the processes that one sees at work today under human occupation. Indeed, a class of facts which Brunhes labeled "facts of destructive occupation," such as soil erosion, are most literally expressions of human geomorphosis. The entire question of narrowing subsistence limits which confronts man in many parts of the world, apart from the question of the greater number of humans among whom the subsistence may need to be divided, is directly one of man as an agent of surficial modification. Even the most physically minded geographer is driven therefore to this extent into the examination of human activity.

There has, however, never been a serious attempt to eliminate the works of man from geographic study. The Germans have long had a phrase, "the transformation of the natural landscape into the cultural landscape"; this provides a satisfactory working program, by which the assemblage of cultural forms in the area comes in for the same attention as that of the physical forms. In the proper sense all geography is physical geography under this view, not because of an environmental conditioning of the works of man, but because man, himself not directly the object of geographic investigation, has given physical expression to the area by habitations, workshops, markets, fields, lines of communication. Cultural geography is therefore concerned with those works of man that are inscribed into the earth's surface and give to it characteristic expression. The culture area is then an assemblage of such forms as have interdependence and is functionally differentiated from other areas. Camille Vallaux in *Les sciences géographiques*

(Paris 1925) finds the object of inquiry to be the transformation of natural regions and substitution therefor of entirely new or profoundly modified regions. He considers the new landscapes which human labor creates as deforming more or less the natural landscapes and regards the degree of their deformation as the veritable measure of the power of human societies. In this sense then he finds the physical area expressed through two sorts of modalities, those that limit and those that aid the efforts of the group. A persistent curiosity as to the significance of the environment is unaffected here by any compulsion to dress up the importance of the environment. The facts of the culture area are to be explained by whatever causes have contributed thereto, and no form of causation has preference over any other.

Such a method of approach is entirely congenial to the geographer. He has been accustomed to regard the genesis of the physical area and he extends similar observations to the culture area, which has a somewhat simpler and more exact form than the culture area of the anthropologist. The geographic culture area is taken to consist only of the expressions of man's tenure of the land, the culture assemblage which records the full measure of man's utilization of the surface—or, one may agree with Schlüter, the visible, areally extensive and expressive features of man's presence. These the geographer maps as to distribution, groups as to genetic association, traces as to origin and synthesizes into a comparative system of culture areas. The experience in geomorphologic study provides the necessary technique of observation and a basis for evaluating the modalities stated by Vallaux. A geography such as this is still an observational science utilizing skill in field observation and cartographic representation, and geographic therefore in methods as well as objective.

The development of cultural geography has of necessity proceeded from the reconstruction of successive cultures in an area, beginning with the earliest and proceeding to the present. The most serious work to date has concerned itself not with present culture areas but with earlier cultures, since these are the foundation of the present and provide in combination the only basis for a dynamic view of the culture area. If culture geography, sired by geomorphology, has one fixed attribute it is the developmental orientation of the subject. Such a slogan as "geography is the history of the present" has no

meaning. An additional method is therefore of necessity introduced, the specifically historical method, by which available historical data are used, often directly in the field, in the reconstruction of former conditions of settlement, land utilization and communication, whether these records be written, archaeologic or philologic. The name *Siedlungskunde* has been given by the Germans to such historical studies and they have been furthered especially by Robert Gradmann, editor of *Forschungen zur deutschen Landes- und Volkskunde*, and Otto Schlüter. A compact view of attainments and problems is given by the former in "Arbeitsweise der Siedlungsgeographie" in *Zeitschrift für bayerische Landesgeschichte* (1928, p. 316-57). August Meitzen gave great impetus to field studies by asserting the extraordinary persistence of field forms (*Flurformen*) and village plans as culture relics (*Siedlung und Agrarwesen der Westgermanen und Ostgermanen*, 3 vols., Berlin 1895). Although many of his conclusions have fallen, the inertia of property lines has proved a most valuable aid in determining inherited conditions. Whereas much has been attained in the reconstruction of rural culture areas, the anatomy and phylogeny of the town as a geographic structure are less well advanced to date. They are at present being pioneered by numerous studies, most particularly in France and Sweden. Important generalizations have not yet appeared, but a technique of analysis is emerging.

A logically integrated development is also under way in economic geography as participating in the culture geography program (Pfeifer, Gottfried, "Über raumwirtschaftliche Begriffe und Vorstellungen und ihre bisherige Anwendung in der Geographie und Wirtschaftswissenschaft" in *Geographische Zeitschrift*, vol. xxxiv, 1928, p. 321-40, 411-25). Localization of production and industry is no longer the major aim as in the familiar economic geography which taught distributions of commercial products and analyzed them. This now becomes a device in synthesis, not an objective in itself. The economic geography that is in the making is nothing else than culture geography carried down to date, for the culture area is essentially economic and its structure is determined by historic growth as well as by the resources of the physical area. The title of pioneer belongs to Eduard Hahn, who broke with the purely speculative culture stages of gathering, nomadism, agriculture and industry and formulated a set of economic form associations, of which the system of

hoe culture has become best known. Also he disproved a general succession in culture stages and demonstrated the lateness of nomadism as a culture form, first as "Die Wirtschaftsformen der Erde" (in *Petermanns Mitteilungen aus Justus Perthes' geographischer Anstalt*, vol. xxxviii, Gotha 1892, p. 8-12), *Die Entstehung der Pflugkultur* (Heidelberg 1909) and *Von der Hacke zum Pflug* (Leipsic 1914, 2nd ed. 1919).

Cultural geography then implies a program which is unified with the general objective of geography; that is, an understanding of the areal differentiation of the earth. It rests largely on direct field observations based on the technique of morphologic analysis first developed in physical geography. Its method is developmental, specifically historical in so far as the material permits, and it therefore seeks to determine the successions of culture that have taken place in an area. Hence it welds historical geography and economic geography into one subject, the latter concerned with the present day culture area that proceeds out of earlier ones. It asserts no social philosophy such as environmentalist geography does but finds its principal methodic problems in the structure of area. Its immediate objectives are given in the explanatory description of the data of areal occupation which it accumulates. The major problems of cultural geography will lie in discovering the composition and meaning of the geographic aggregate that we as yet recognize somewhat vaguely as the culture area, in finding out more about what are normal stages of succession in its development, in concerning itself with climatic and decadent phases and thereby in gaining more precise knowledge of the relation of culture and of the resources that are at the disposal of culture.

CARL SAUER

HUMAN. However human geography may be defined, it cannot be called a new science. Yet the designation is barely fifty years old, dating from Friedrich Ratzel's *Anthropogeographie*, and was not readily accepted. Vidal de la Blache, who as late as 1910 expressed his opposition to the term and preferred to speak simply of geography, changed his attitude and in his last years wrote his *Principes de géographie humaine*, which was published after his death. The term emphasizes the division of the geographical sciences into two groups, by which physical geography, the synthetic study of the surface of the earth, is distinguished from human geography, the

synthetic study of the relationship between human societies and that surface. As long as geography meant simply a description of the surface of the earth and of man's work on that surface there could be one science of geography. During this long descriptive period, when the investigation into causes, although never completely absent, was rare and fragmentary, the two geographies were blended. One could not conceive of physical geography separate from human geography, a fact noted by Strabo, the first of the great geographers who limited the province of the science of geography to the inhabited world. Physical and human geography still have in common the fact that both are sciences dealing with the substance of the surface of the earth, and not with man. Physical geography belongs among the natural sciences. Human geography is a natural as well as a social science, but treats of man only as far as the substance of the surface of the earth is affected by him or to the extent that physical forces affect his individual or collective life. On the other hand, since human activity is sufficiently powerful to modify the balance of the physical forces of a certain region, physical geography has been forced to take into account human activity and to become in its turn an extension of human geography.

The connection between man and the physical environment which first presents itself is the theory of the determinant influence of environment, the idea that the development of human societies is influenced in one way or another by the natural conditions under which they live. Among these conditions climate seems the most important, for on it depend directly the flora and less directly the fauna, which because of man's elementary requirements, food and clothing, form the essential basis of human life. The theory of the determinant influence of the climate dates from as far back as Hippocrates, but was expressed most clearly in the eighteenth century by Vico, Montesquieu and Herder. Considered in this way human geography is but an extension of physical geography. But one of the first discoveries made by the social and political sciences consisted in the realization that by no means all the factors which control human societies are physical—that physical determinism exercises only a certain limited influence upon the life of societies. Human geography may thus be defined as the science which deals with the adaptation, in the widest sense, of human groups to their natural environment: passive adaptation when they subject themselves with no or with

little resistance to the action of physical forces, as occurs in the failure of men to settle certain regions; active adaptation when man to a greater or lesser extent modifies the surface of the earth, as is everywhere the case in regions in which man is present. These definitions must not be taken in their strictest sense. In the inhabitable part of the earth there are few regions which reveal no mark of man's activity; still rarer are those regions where every trace of the original landscape, as it existed before the coming of man, has disappeared. All over the globe instances of active and passive adaptation occur side by side.

While an adverse environment may mean a limitation or restriction of human existence and may go to the extent of making it impossible, a favorable environment can present only possibilities which, however favorable, may frequently not be taken advantage of. Physical determinism applies almost exclusively to the most adverse conditions of environment. For the exploitation of favorable conditions of environment physical determinism must combine itself with social determinism or, in other words, with a number of collective incentives and forces, among which the share originally due to the natural environment is frequently imperceptible or completely lacking. Geography can determine the limits of the human habitat—the limits of the *Ökumene* and the *Anökumene*, to use Ratzel's expression—by fixing the limits of latitude beyond which all normal human life is impossible and likewise the limits of altitude on terrestrial elevations, themselves variable according to the latitude. It can also mark out similar limits around the uninhabitable portions of certain deserts, sections devoid of all life and all means of life, like the *Tanesruft* in the Sahara. It is of little significance that men can exist in these regions, as do polar explorers, alpinists and desert explorers; they cannot live there in settled groups. In these instances physical determinism imposes itself with severity. On the other hand, regions with a climate in which moderate fluctuations of temperature, sufficient sunshine, and rainfall distributed over all the seasons assure the best conditions for the development of plants, especially the plants utilized by man, do not necessarily witness the steady development and prosperity of human societies. Even a perfunctory knowledge of history and a glance at a map of the world reveal quite the opposite. There are regions with an excellent climate in which human life at first flourished and later lost

its strength or vice versa, without any natural causes to explain these fluctuations, so that such writers as Hegel could go to the extent of denying the existence of any scientific relationship between natural conditions of this kind and the life of human societies. Since frequently unfavorable natural conditions themselves do not result in the complete prevention of human life, one can see the limited role of physical determinism in human geography. The real interest and the real object of the science lie elsewhere. They lie in the phenomena of active adaptation, which human societies display when they transform a landscape, civilizing it by cultivation, utilization and communications of all sorts, and when they transform natural regions comprising a group of areas into human regions. The latter do not necessarily correspond with the natural regions, and the aspect of the civilized landscape greatly differs from that of the natural landscape which it displaces or transforms. Thus the essential facts studied by human geography become distinct in proportion to the extent of the transformation of the original landscape. One can classify them in a regular series—from the least complex, when the original landscape remains almost intact, to the most complicated, when it is almost completely hidden or transformed—a method which is not invariably successful.

The natural landscape underwent few changes and the human landscape barely existed during the primitive stage of fruit gathering, hunting, fishing, foliage huts or rock shelters, when people were scattered and went about naked or covered with animal skins, possessing few implements and no political organization, as, for example, the *Tierra del Fugians* as described by Darwin. In the agricultural-pastoral stage the natural landscape begins to become a human landscape and becomes increasingly so as rural civilization flourishes. These transformations never efface the essential characteristics of the former landscape, for rural civilization strives to adapt itself to the landscape without destroying it. Doubtless great differences exist between the clearing in the jungle of equatorial Africa with its huts and a few fields, the Moroccan village with its earth colored houses sunk into the ground and the cultivated fields of Picardy with their groups of towns and farms, but these various stages of civilization are comparable in that in each case a gradual adaptation to the landscape took place simultaneously with the domestication of animals and of useful plants. The geographical configuration of the agricultural-

pastoral landscape is completed by the market town, which is the center of a settlement with a definite radius of influence. The commercial city, larger than the market town and often connected with a state organization, unites the commercial interests of a much greater radius than that of the market town and maintains direct communications with similar settlements elsewhere. Urban settlements of moderate size form a part of that agricultural-pastoral civilization and frequently reveal the influence of the natural conditions prevailing in the part of the world where such a civilization exists. The influence is usually apparent not in the general characteristics of the settlements, but in a number of habits and customs—housing, agricultural implements, food and rural economic and agronomic techniques. Hence the notion of the *genres de vie* popularized in France by Vidal de la Blache, which applies more or less to all types of human activity studied by human geography.

The transformation of the landscape increases with the industrial stage, with the advent of the machine in industry and in the transportation of men and goods. Generally speaking, the agricultural-pastoral civilization respects the landscape and strives to adapt itself to it while the industrial civilization demolishes it and transforms it completely. It remodels the appearance of the earth almost entirely, breaking up and removing the surface of the soil with quarries and mines or burying it under slag; leveling it by means of enormous industrial plants, ports, railway stations, tracks and viaducts; covering it with large cities even attempting artificially to revive the original landscape through parks and gardens. Large cities spread and unite, forming urban regions, and no connection with the natural region any longer exists.

This descriptive method applied by human geography not only permits a search for causes but also forms an important aspect of geography because of the analysis and the interpretation of the general conclusions which it involves, even though these activities belong to a field in which geography merges with sociology, especially with that branch of sociology which in France is called *morphologie sociale*. The establishment of rapid and convenient lines of communication over land and sea amounts to a reduction in the size of the earth and brings about a more and more direct contact between large human groups, with all the social, economic and political repercussions which this fact involves. Easy communication makes possible the increasing concen-

tration of people and the gigantic growth of large urban areas in proportions which would be unimaginable if food could not be supplied by rapid transportation. The enormous increase in the means of subsistence and of labor involved in large scale industry and the mass exchange of goods is the principal cause of the rapid increase of the population of the earth. It is also the cause of the important phenomenon that densely populated, newly stocked regions tend to increase their population still further, while long settled regions with a sparse population constantly lose inhabitants; hence the increasing inequality of the distribution of man over the inhabited part of the earth which goes hand in hand with the overpopulation of the large cities. The intensive exploitation of natural resources by agriculture and industry raises the question whether some may not possibly become exhausted, a question which except in certain definitely limited instances geography answers in the negative chiefly on the ground that human labor is able to adapt itself with great flexibility.

CAMILLE VALLAUX

ECONOMIC. Economic geography, although young as a scientific discipline, is ancient as an applied branch of knowledge. The Indian peddlers of Central America and the Hausa traders of Central Africa are acquainted with the production and consumption, the physical conditions, natural resources and trade routes of considerable areas. Doubtless the same held true for the traders of the period of the prehistoric lake dwellers in Europe, who frequently traveled long distances. Large scale traders or manufacturers of civilized countries in conformity with the demands of the new era need an international outlook and a knowledge of economic geography in order to work profitably. Many commercial reports made for large business houses are excellent dissertations on economic geography, which will be fully developed as a scientific discipline only when merchants and farmers dealing in the international market avail themselves of the findings of scientific geography and economics. This may be anticipated in the light of the admirable monographs which some practical agriculturists such as von Thünen and Engelbrecht have produced. Unfortunately, men who have distinguished themselves in practical fields have rarely recorded their experiences in the form of writings on economic geography. The geographer usually lacks sufficient insight into complicated economic mechanisms—which

the most detailed statistics cannot remedy. Nor can theoretical knowledge of economics fully compensate for the lack of personal practical experience.

Historical and geographical works from the time of Herodotus and Strabo have given merited attention to the importance of economic activities. Sebastian Münster in the sixteenth century gave systematic accounts of the economic life of countries and cities. In the latter half of the eighteenth century Büsching did this more thoroughly, Turgot planned a system of economic geography and von Humboldt undertook his highly important voyage to the Spanish-American colonial empire, which, due especially to his study of the economic and geographical peculiarities and divisions of the tropics, was exceedingly fruitful not only for physical but also for economic geography. Ritter, the first to lay the foundations of a human geography, approached the subject historically and sought to explain the transmission of cultivated plants and domestic animals. Hahn continued such inquiries, List contrasted the economics of warm and cold countries, and Kohl founded the geography of settlement and commerce. In 1882 Ratzel published his important work, *Anthropogeographie*. Ratzel's general work was continued by French scientists, especially Vidal de la Blache and Brunhes, while German geographers continued to concentrate mainly on the economic aspects of geography. Götz, a pupil of Ratzel, published in 1882 a program for the organization of the field of economic geography, a name which he was the first to employ. He assigned to economic geography, in contrast to commercial geography, which had chiefly served practical ends, the scientific task of dealing with the nature of world areas in their direct influence upon the production of commodities and the movement of goods. Economic geography and physical geography thus parted ways. Götz nevertheless continued to place the main stress upon the geographical foundations of economics, as did many others after him, as, for example, Jones and Whittlesey, while von Richthofen, Eckert and Friedrich strongly emphasized the role of man as an economic being. Chishom, Lütgens, Sapper and Braun considered these two fields as equally important and investigated man's influence upon his environment. According to Hettner economic geography is concerned with the economic potentialities and the relationships of the various countries and localities, while Rühl following Robinson considers its subject

matter to be the geographical distribution of labor and the differences in the quality and quantity of the production, the commerce and the consumption of various districts. Methodological discussions of the aims, the limits and the methods of economic geography, which play an important part in the works of the German geographers, especially Sieger, Friedrich, Dove Hassert, Hettner and Rühl, are less conspicuous in the French literature. Sieger excludes the field of colonization, which according to Brunhes is to be included in the discipline. In the Soviet Union economic geographers under the leadership of Bernstein-Kogan and Baransky are no longer interested in the bare descriptive statistical inquiries that characterized prerevolutionary Russian economic geography, but are specializing in intensive studies of the present regional distribution of types of economic activity and of natural resources and in devising principles and practical programs for a coordinated development of these resources in terms of regional integration.

Economic geographers and economists frequently use the same source materials, but their ways of exploiting them are essentially different. Economic geography considers primarily the relationship between human economic activity and an area with its material resources. It thus confines itself to the investigation of such objects as possess a certain duration, while neglecting many a transitory phenomenon which the economist considers significant. Accordingly, Rühl prefers to speak of economic geography as a border discipline between geography and economics, while Hettner regards it as being a division of geography, a division which maintains a close relationship with cultural geography and concerns itself with the geographical distribution of the sources of material and to some extent with non-material subsistence. In any case economic geography belongs to the border regions of geography and is not far removed from economics, into which field it often overlaps. Economic geography is also closely connected with political geography, since commerce and economic life are today often much more decisively separated by political frontiers than by physiographical barriers, which can frequently be surmounted with relative ease by modern technique. Because of the customs barriers connected with them political borders often divide a natural region in such a manner that the divisions are obliged to develop their economic systems along completely different lines.

Economic geography may be divided into the geography of production, the geography of commerce and the geography of consumption. The last mentioned field was clearly defined only by Schmidt as late as 1929. As commerce presupposes traffic, the economic geographer also includes the geography of transportation in his field.

Before theoretical discussion of economic geography began, an enormous mass of economic observations gathered from all areas and countries of the earth had been accumulating ever since official and private explorers of foreign regions had first focused their attention on economic facts and potentialities. The desires of commerce and industry to acquire raw materials and to find new markets for their products led economic councils, chambers of commerce, associations for the advancement of commercial geography and other organizations to investigate economic prospects at home and abroad. When the great powers increased their colonial possessions or acquired them for the first time, especially in the second half of the nineteenth century, many publications appeared which greatly increased man's knowledge of economic conditions in foreign regions. In order to provide for surplus populations emigration societies and governments have also conducted detailed investigations of regions under consideration for settlement. The results of numerous investigations undertaken on behalf of private business have been treated as business secrets and have become known to wider circles only through their effects on trade or on productive economic enterprises. There is no doubt, for example, that there are some oil companies which are far better informed about the geology of certain districts than are the geological institutions of their governments.

Regional economic geography has either occupied itself with the spatial aspects of political units or dealt with natural units in terms of economic districts and provinces in an attempt to acquire data to determine the location of industrial sites. The solution of these problems has required the consideration not only of physical geographic factors but also of the many other social, cultural and political factors which exercise an effect on economy. General economic geography, on the other hand, has not advanced beyond beginnings, and even in agricultural geography the available material has not been sufficiently exploited. The objective of the economic geographer is, however, not only to de-

scribe the degree to which man has exploited the possibilities of the physical environment but also to anticipate the future by pointing out possible or desirable future developments and by preventing the wasteful depletion of natural resources.

In works on economic geography the textual presentation is frequently supplemented by charts. Cultivation, mining and industrial charts date from the seventeenth century, while more complicated economic charts have come into use only in more recent times. Since the cost of production of these charts, especially if they are colored, is quite high, there is a tendency to compress as much as possible into a single sheet. Therefore colored spaces, color gradations, colored lines and dots or shaded drawings are used. Unless overcrowding is skilfully avoided this system, however, often produces an almost confusing picture; the economic atlases published by Bartholomew in 1907 and that prepared by Philip and Sheldrake for the chambers of commerce in 1925 are representative of a superior type. In opposition to the method of representing numerous individual products on a single sheet, some economic geographers, as, for example, Passarge, Schmidt and Heise, have recently portrayed separately the regions of production and the routes to the countries of consumption of each individual product. A new and significant method, used for the first time in 1917 by Finch and Baker, has found wide acceptance. The principle of this relative method, which permits of a very clear distinction between central and peripheral regions, consists in indicating each unit quantity of a product by placing a dot at the place of its occurrence. This method cannot be applied to countries for which no relevant statistics are available—a considerable disadvantage.

The number of research institutions in economic geography has recently been increased by the establishment of new chairs; at the same time economic geography is rapidly becoming a distinctive part of the curriculum of higher schools of business. The establishment of magazines serving the interest of economic geography, such as *Economic Geography* (published quarterly by Clark University since 1925) and *Erde und Wirtschaft* (published quarterly in Brunswick since 1927), is also encouraging more intensive study of the subject.

GEORGE III (1738-1820), king of England (1760-1820). George III, who at the age of twenty-two succeeded his grandfather, George II, reflected in his private life the high if limited ideals of the English Puritan tradition, but his public principles and conduct were in closer accord with the ideas of a German court than with the English political temper. True to his mother's injunction to "be a king," he determined to recover at least the personal power exercised by William III. In the course of ten

years he succeeded, by fostering the sectional jealousies of the Whigs, in freeing himself from the group which had dominated his two predecessors. Instead of a Whig administration directed by a party leader he introduced a government of Tory ministers chosen by himself and individually responsible to him for the execution of his will. From 1770 to 1782 he was virtually prime minister, not only directing general policy but deciding detailed questions of administration, especially in military affairs. Unlike the Stuarts he did not attempt to over-ride Parliament but obtained a majority for his government in the Commons by winning over the Tories and creating a small party of his own, the "King's Friends," as well as by a judicious use of influence, patronage and bribery. This system of personal rule might have lasted longer had it not been discredited by the American fiasco. George III cannot, of course, be held responsible for the revolution. In repudiating the colonial claims and resorting to coercion he was supported at the outset by the bulk of English opinion. The protraction of the war, however, was due mainly to his obstinate refusal to compromise. Yorktown deflated his majority in the Commons and forced him to accept a change of ministers. After 1784 policy and administration were no longer controlled by him, except on one or two historic occasions, but by the younger Pitt acting as a real prime minister with a cabinet of his own choosing. This transference of power was confirmed by the recurrent mental disorder which together with blindness and domestic trouble clouded the later years of his long reign.

GEORGE, HENRY (1839-97), American economist. His father was a publisher in a small way in Philadelphia and his limited income had to be divided among a large family. George's schooling was scant, whether from ineptitude at study or financial necessity the record does not clearly show. In his teens he went to sea and after a brief return to the restricted atmosphere of his intensely religious home he settled on the Pacific

coast. Drifting finally into reporting, he became an editor and something of a newspaper entrepreneur but with uniform lack of success. He married when young, and family responsibilities together with the intermittent nature of his jobs caused him to lead a rather poverty stricken existence, in which actual hunger sometimes figured.

As he grew older he developed a sense of serious philosophic need, for which he found no ready answer. He possessed neither talent nor training for patient inquiry; he questioned the world rather than its thinkers. The problem of poverty, which had so often posed itself and which he saw all about him in the backwash of Civil War times, seemed to him the center of humanity's woes. The discovery of a solution was probably assisted by the peculiarities of the situation in California, where, through a telescoping of historical processes, the rich new country with all its potentialities had within a few decades fallen into the hands of a small group of greedy speculators. At length in 1869 he had a flash of insight, which he compared to the "ecstatic vision" of mystics and poets. It was the selfish monopolization of nature's gift, land, that kept man poor.

After eight years of groping elaboration of this theme, first in the pamphlet *Our Land and Land Policy* (San Francisco 1871), later in the columns of numerous newspapers, George began to write *Progress and Poverty* (San Francisco 1879). Then for the first time he turned to the writings of the economists—mostly English—Ricardo, Malthus, Mill and others. Like Marx before him he accepted much that he found there; in particular the Ricardian law of rent appealed to him as axiomatic, but he gave to it and to its corollaries a new orientation and meaning. His theory concentrated upon the field of distributive economics rather than of production or of consumption. He rejected the current doctrines of wages and interest and sought for an explanation to support his conviction that all distributive shares were interdependent. This explanation he discovered by expanding the law of diminishing returns and of a margin of production. In contrast to J. B. Clark, who applied the marginal principle to each separate factor, George, regarding labor and capital as "but different forms of the same thing—human exertion—" and as tending to an equivalence of reward, made their shares a residual from the marginal productivity of land. But while labor and capital were productive only by the permis-

sion and assistance of natural agents they alone were truly productive. Rent was an unearned increment and it reduced wages and interest by its total amount. With progress, which led to greater land scarcity, the grip of the landlords tightened. The problem was to free the real producers of wealth by dispossessing the holders of the unearned increment.

Armed with this doctrine and fired with the apostolic zeal of a man who had found truth not in books but by slow assimilation of experience, George left San Francisco for New York in 1880. Shortly after his arrival *Progress and Poverty*, which had at first attracted little attention, began to catch the popular imagination and to sell enormously wherever books were read. With its passionate eloquence and inspired style it filled the need of the time not only for an exposition of the direful effects of landlordism but for a new social philosophy offering a simple program of reform to a harassed world. For George's program possessed perfect simplicity. Neither the confiscation of land nor the communization of its use seemed to him necessary; he merely proposed to "appropriate all rent by taxation . . . to abolish all taxation save that upon land values." He became something of a prophet and lectured widely at home and abroad. In England his book and his agitations had a resounding influence on the young intellectuals of the incipient Fabian Society. Of the numerous disciples who gathered about him in America many were men of wealth and influence, attracted perhaps by the fact that his scheme seemed to offer no threat to the business system. In the early years he also received an enthusiastic welcome from the trade unions, to whom he appeared less as the bearer of a specific doctrine than as a vague symbol of protest against corruption and injustice. In 1886 the Central Labor Union together with a group of socialists importuned him to enter the race for mayor of New York. He was defeated by only a narrow margin and might perhaps on an honest count have been elected. But the chief result of the famous campaign was to clarify his position and to consolidate his supporters into a homogeneous group freed from the entangling influence of divergent and more radical doctrines such as socialism. During the succeeding years the movement crystallized into its permanent form, working through numerous organizations and devoting itself to sporadic political and persistent propagandizing efforts. From 1887 on, the term single tax, misleading in that it was a direct

translation of the *impôt unique* of the physiocrats, whose works George admired at second hand but from whose theories his own doctrine differed widely, became its distinguishing slogan. George died in 1897 in the midst of his second New York mayoralty campaign, leaving the *Science of Political Economy* (New York 1897), a more formal exposition of his ideas, for posthumous publication. The agitation continued to grow after his death, but on the whole it has spent itself with very little practical result beyond a few attempts to transfer the burden of taxation from the value of improvements to the value of land.

R. G. TUGWELL

Important works: *The Irish Land Question* (New York 1881); *Social Problems* (New York 1883); *Protection or Free Trade* (New York 1886); *The Condition of Labor* (New York 1891); *A Perplexed Philosopher, Being an Examination of Mr. Herbert Spencer's Various Utterances on the Land Question* (New York 1892). His complete works have been published in ten volumes (New York 1906-11), the last two of which are the standard biography of Henry George by his son.

Consult: Post, L. F., *The Prophet of San Francisco* (New York 1930); Young, A. N., *History of the Single Tax Movement in the United States* (Princeton 1916); Commons, J. R., and others, *History of Labour in the United States*, 2 vols. (New York 1918) p. 446-61; Teilhac, Ernest, *Histoire de la pensée économique aux États-Unis* (Paris 1928) p. 112-68; Beer, Max, *History of British Socialism*, 2 vols. (London 1919-20) vol. ii.

GERBER, KARL FRIEDRICH WILHELM VON (1823-91), German jurist. Gerber played a preeminent part in the development of both private and public law in Germany. In his youth he was greatly influenced by the historical school and later by his friendship for Jhering. With the latter he became the founder of a new historical school, and both changed gradually from a subservience to the folk spirit to a more austere dogmatism of rational concepts. Gerber's scientific development is very typical of the juridical trend of his period, which turned from common law to codification. In *Das wissenschaftliche Princip des gemeinen deutschen Privatrechts* (Jena 1846) he conceived the German common law to be hardly more than a repository of German juridical consciousness. If a historical jurisprudence was necessary to crystallize it, a dogmatic jurisprudence was necessary to adapt it to contemporary needs. The repudiation of the romantic was even more clearly evident in his *System des deutschen Privatrechts* (2 pts., Jena 1848-49; 17th ed. by K. Cosack, 1895), which at the same time shows a transition from the particularism

of Germanic legal institutions to a conceptual Romanistic art of systematization.

This trend toward positivism is completed in his *Grundzüge eines Systems des deutschen Staatsrechts* (Leipsic 1865, 3rd ed. 1880), which owed much to Albrecht and in turn became the foundation upon which Laband built his system of public law for the German Empire. Gerber's conception of the personality of the state and of the state as a sovereign person reflected the new political situation of Germany, which was no longer the patrimonial state of the Middle Ages nor yet the sovereign state of the period of absolutism.

Gerber had too keen a sense of political realities to lose himself in the barren wastes of fine abstractions and mere formalism to which his theory led others. He was able to accommodate it to the imperial period which followed and devoted the latter part of his life to practical politics as Saxon minister of public worship and education.

ERNST VON HIPPEL

Consult: Stintzing, R. von, and Landsberg, E., *Geschichte der deutschen Rechtswissenschaft*, 3 vols. (Munich 1880-1910) vol. iii, pt. ii, p. 778-88, 825-33.

GERHOH OF REICHERSBERG (1093 or 1094-1169), German theologian and political theorist. Gerhoh was born in Bavaria and in 1132 became provost of the Collegiate Church of Reichersberg. His temperament and principles are singularly interesting as revealing an attitude toward church reform which was probably not uncommon but which is only slightly represented in the literature of the time. His starting point was a strict adherence to the dualistic nature of authority and division of function. Profoundly devoted to the Holy See, he yet severely reprehended whatever political tendencies in the church seemed to vitiate its spiritual work. He was at the same time a loyal subject of the empire and resolutely criticized what he conceived to be papal aggressions upon its rights. In his earlier treatises, *De aedificio Dei* (written between 1126 and 1132), *De ordine donorum Sancti Spiritus* (1142-43) and *De novitatibus huius temporis* (1155-56), he shows himself perplexed about the problem of the *regalia*, those quasi-political rights and dignities which Pope Paschal II had proposed to surrender if the emperor would concede the claim to investiture. While Gerhoh hesitated to advise the surrender of the *regalia* he was one of the very few ecclesiastical writers who lamented

their effect upon the spiritual office, his principal objections being that they absorbed time and entailed duties unbecoming to churchmen. In the later treatises, beginning with *De investigatione Antichristi* (1161-62), Gerhoh concerned himself with the violent conflict between Frederick Barbarossa and the papacy which had broken out at the papal election of 1159, when the majority of cardinals had chosen Alexander III and the minority had set up Frederick's candidate as a rival pope. After some hesitation Gerhoh gave Alexander his unflinching support; but his profound distress over the charge that Alexander's election had resulted from a conspiracy entered into by certain members of the Curia, the Normans of Sicily and the Milanese against the emperor illustrates his dismay at the pollution of the sacred power by political considerations. Even after his expulsion from Reichersberg in his old age for fidelity to Alexander the fine sanity and balance of Gerhoh's mediating attitude remained undisturbed. In *De quarta vigilia noctis*, written the year before his death, he unsparingly censured the worldliness of the church, pointing to avarice as its chief vice and capping his reiterated plea for the strict separation of powers by an expression of doubt as to the justice and wisdom of the existence of papal states.

A. J. CARLYLE

Important works: *De aedificio Dei* in J. P. Migne's *Patrologia latina*, vol. cxciv (Paris 1855) cols. 1187-1336; selections from it appeared in *Monumenta Germaniae Historica, Libelli de lite imperatorum et pontificum*, 3 vols. (Hanover 1891-97) vol. iii, which contains also selections from *De ordine donorum Sancti Spiritus*, *De novitatibus huius temporis*, and the first book of *De investigatione Antichristi*, all ed. by E. Sackur; selections from *De investigatione Antichristi* ed. by J. Stültz appear in *Archiv für österreichische Geschichte*, vol. xx (1858) 127-88.

Consult: Carlyle, R. W. and A. J., *A History of Mediaeval Political Theory in the West*, vols. i-v (Edinburgh 1903-28) vol. iv, pt. iv, ch. iii; Nobbe, H. F. A., *Gerhoh von Reichersberg* (Leipsic 1881).

GERLACH, ERNST LUDWIG VON (1795-1877), German publicist and statesman. Gerlach was one of the founders of the Conservative party in Prussia and a leading exponent of conservative principles both in parliament and in the press. He belonged to that class of conservative government officials who being descended from the knightly nobility carried on occasion their independence in politics to the point of turning their conservatism against the government. Like his father, who had resigned a high administrative

post because of antipathy to Stein's reforms, Gerlach was always something of a *frondeur*. With no agrarian connections and no zest for soldiering he was not a typical Prussian but rather an objective and internationally minded critic of Prussianism. In his political philosophy he was influenced first by Savigny's faith in unhampered organic growth as opposed to rationalistic reform and later by Haller's theory that the historically evolved "natural order" was divinely ordained; but he came to recognize that the capstone of a conservative system must be the belief in a supernatural absolute order at the basis of all reality. He regarded political life from the point of view of a jurist and moralist rather than a statesman; accepting Haller's interpretation of political relationships in terms of private law he strengthened it further by harmonizing it with a religiously sanctioned ethical imperative. The need that Gerlach felt to establish upon a fixed and authoritative basis the immutable moral principles which govern law and politics led him to ground his political philosophy in theology. He inclined toward the Roman Catholic church based as it was on authoritarian principles with a creed which is not subject to varying interpretations and with a clearly defined interest in politics. But absolutism as a political principle or a form of government represented to Gerlach "revolution from above"; this conservative who abhorred revolution in any form thus often approached liberalism in theory, tended to align himself with the constitutionalists rather than the nationalists and ultimately felt drawn into the ranks of the Center. The reign of Frederick William IV with its departure from a narrow Prussian policy marked the height of Gerlach's political prestige and the year 1848 the climax of his practical influence. As long as problems of internal statecraft had precedence over foreign policy and long time considerations over the exigencies of the moment, as happened during the half century of peace following 1815, Gerlach with an essentially static philosophy and so inflexible a personality was in his element. But with the ascendancy of Bismarck, particularly after the wars of 1866 and 1870-71, Gerlach's career came to an end. He refused to follow his party into Bismarck's camp and subjected Bismarck's policies to thoroughgoing criticism. He was disciplined and eventually dismissed, and the party press was closed to him. Although he turned to pamphleteering he gradually lost virtually all of his followers. Yet the almost fanatic loyalty to his convictions and the fearless de-

fense of his ideas while respecting no government or party were always impressive.

ALFRED VON MARTIN

Consult: Martin, A. von, "Autorität und Freiheit in der Gedankenwelt Ludwig von Gerlachs" in *Archiv für Kulturgeschichte*, vol. xx (1930) 155-82.

GERLACH, OTTO ADOLPH JOSEPH (1862-1923), German economist. Gerlach studied mathematics and physics and later social science and agronomy as a student of Roscher, Schmoller, Wagner and Stämmler. In 1903 he was appointed professor of political science at the University of Königsberg. His most important works are in the fields of value, finance and agrarian problems. In his inaugural dissertation, *Über die Bedingungen wirtschaftlicher Tätigkeit* (Jena 1890), he subjected the value theories of Marx, Knies, Schäffle and Wieser to a critical examination. In contrast to the views of these authors Gerlach attempted to prove that a uniform relation of man to goods is neither possible nor necessary in explaining economic phenomena. Man's relation to goods is of a twofold nature. The relation to consumption goods is in the realm of the affective, of the sensations of pleasure and pain; it is therefore necessarily subjective and incapable of objective measurement. Man evaluates producers' goods, which are a means to an end, through cognition; the relation is therefore objective and susceptible to quantitative treatment.

In the field of finance Gerlach applied himself to problems of taxation policy and the history of fiscal literature. His other works are of a descriptive and statistical character and deal with problems of agricultural labor, land settlement, the significance of landed property and preservation of the peasant class.

KARL BRÄUER

Works: *Die preussische Steuerreform in Staat und Gemeinde* (Jena 1893); *Zur Reichsfinanzreform* (Berlin 1906); *Die Reichsfinanzreform von 1909* (Berlin 1911); "Geschichte der Finanzwissenschaft" in *Die Entwicklung der deutschen Volkswirtschaftslehre im neunzehnten Jahrhundert*, 2 vols. (Leipzig 1908) vol. ii, ch. xxxviii. Gerlach revised and enlarged the 5th ed. of Roscher's *System der Finanzwissenschaft* (2 vols., Stuttgart 1901).

GERLAND, GEORG (1833-1919), German ethnologist and geographer. Gerland, at first a philologist, in 1875 became professor of geography in Strasbourg. His contributions to Theodore Waitz' *Anthropologie der Naturvölker* (of which he wrote vol. v, pt. ii, and vol. vi, Leipzig 1865-72) are still useful as collections of ethno-

graphic material. In his *Über das Aussterben der Naturvölker* (Leipsic 1868) Gerland discussed the nature of child mortality, infanticide and infectious diseases among primitive people, who, he contended, are dying out not because they lack vitality but because they are being forcibly destroyed by European civilization. He also emphasized, however, the importance of psychological factors and of spiritual and cultural disintegration. In his *Anthropologische Beiträge* (Halle 1875) Gerland attempted to introduce into psychology the atomistic-mechanical conception of nature based on the theory of evolution. He believed that universal culture traits developed in one center were carried by man in his migrations from continent to continent and that ethnic differentiations took place by means of different innate talents, isolation and the sum total of the influences of the natural environment. Gerland originally held that a people consists of the sum of single individuals and that the true picture of a people could be constructed only on the basis of complete knowledge of all individuals, a task which he considered capable of solution to a certain degree in the study of primitive groups because of the great similarity of their members. Nevertheless, in his *Immanuel Kant, seine geographischen und anthropologischen Arbeiten: Zwölf Vorlesungen* (Berlin 1906), in which he was the first to point out the significance of Kant's anthropological writings, he recognized Kant's view that the development of human society is a function of the species.

W. E. MÜHLMANN

Consult: Sapper, Karl, in *Geographische Zeitschrift*, vol. xxv (1919) 329-40; Neumann, Ludwig, in *Petermanns Mitteilungen*, vol. lxx (1919) 22-23.

GERMAN CIVIL CODE (*Deutsches bürgerliches Gesetzbuch*, usually abbreviated as BGB). The political history of Germany had been characterized for many centuries by not only political but legal disunity. Each of the German states possessed its own law, which often differed greatly from that of its neighbors. Moreover, the Roman law which had penetrated Germany with the passing of the Middle Ages and had been taught at all the German universities as a "common law" improved the situation very little. The legal maxim was: *Landrecht bricht gemeines Recht*. Thus if a state had its own law, this territorial law had to be preferred to the Romanic common law. It was toward the end of the eighteenth century and in the first part of the nineteenth that this antagonism was ac-

centuated. Several of the more important states during this period adopted codes, for example the Prussian *Allgemeines Landrecht* of 1794 and the Saxon *Bürgerliches Gesetzbuch* of 1863. Other states, as for example Baden, had introduced the French *Code civil* (*Code Napoléon*) as their own territorial law.

The growing demand for German legal unity had two roots, one idealistic and the other economic. The idealistic went hand in hand with German political hopes. The German people were weary of particularism and strove for a unified German Empire that would have a stronger position in the world than a conglomeration of individual states. Such a tendency was first evident after the War of Liberation against Napoleon but it had always been joined with a longing for a unified law for the whole of Germany, more particularly for the creation of a German civil code. But the time was not yet ripe. It was the growth of the spirit of nationalism all over Europe in the second half of the nineteenth century that gave the idealistic movement in Germany the impetus necessary for the creation of such a code. In the meantime the economic forces had also gained strength. Since without unity the growing German economy was hindered at every step, the merchant and the industrialist became its champions. It is indeed noteworthy that success had been achieved even before the founding of the German Empire in completing three general German codes of commercial law: the *Wechselordnung* (law of bills of exchange) of 1849, the *Handelsgesetzbuch* (commercial code) of 1861 and the *Gewerbeordnung* (industrial law) of 1869; these are the historical forerunners of the German civil code. It is also worth noting that Austria participated in the work on the first two codes but had separated from Germany before the drafting of the BGB. Austria lives today under its civil code of 1811; however, it is not beyond the realm of possibility that the German and Austrian civil codes will be amalgamated at some future time.

The drafting of the German civil code occupied more than twenty-two years, from 1874 to 1896. It would be easy to see in this an instance of the proverbial German thoroughness, but it should not be forgotten that codification in other countries has also taken long periods of time. The twenty-two years of the creation of the BGB are divided into five periods of greatly varying lengths: the work of the so-called preparatory commission, 1874; of the first commission, 1874 to 1887; of the second commission,

1890 to 1895; consideration in the Bundesrat, 1895; and in the Reichstag, 1896.

The preparatory commission was charged with drafting a general plan. The principle question was whether something fundamentally new should be created or whether the existing territorial laws should be epitomized after the reconciliation of differences. The layman is likely to imagine that a new code is actually new in content; experience, however, teaches the contrary. Almost always the great codes have embodied only preexisting law; they are only landmarks; they truly only "codify." The members of the preparatory commission recognizing this rejected the principle of innovation and accepted that of codification.

The first commission consisted of eleven jurists. They were very learned but unmistakably oriented toward Roman law, and they laid more emphasis upon logical construction than upon conformity with national characteristics. Their industry and non-partisanship, however, deserve the highest recognition. They worked behind closed doors for thirteen years and made public the so-called *I. Entwurf* in 1888.

The second commission differed from the first in having as members not only jurists but men of affairs, for instance agriculturists and a banker. It is noteworthy that at that time it was not deemed necessary to add a representative of the workers or the trade unions, and the voice of the workers was first heard later in the Reichstag. The second commission introduced a number of important changes in the law, for instance the principle that a habitual drunkard may be declared incapable of managing his own affairs (sect. 6, subd. 3), the provision for the protection of the rights of personality in a name (sect. 12), the right of a marrying daughter to demand a dowry from her father (sect. 1620), further important changes in the law of associations (sect. 21 ff.) and above all certain far reaching measures of social protection in the law of master and servant which deserve recognition as early signs of the reaction against uncompromising nineteenth century individualism. The product of the labors of the second commission was the so-called *II. Entwurf* of 1895.

The participation of the Bundesrat which then followed is to be explained by the character of the constitution of the German Empire at that time. Whereas today under the constitution of 1919 the Reichstag is the sole legislative organ, under the earlier constitution the consent of two legislative organs was necessary, the

Reichstag and the Bundesrat, the latter composed of the representatives of the twenty-five separate states. Although the historical role of the Bundesrat was to guard the interests of the old particularism, it did not act as its conservator in the drafting of the BGB. Except in a few instances it too was inspired by the thought that Germany needed a unified law that would be superior to the forces of particularism. On the other hand, political considerations did impel the Bundesrat to one important alteration. It had been intended to integrate the fundamental principles of the conflict of laws, or private international law, in the codification of the domestic German law. The Bundesrat, however, fearing that international complications would follow, has eliminated the provisions which it regarded as dangerous. The result is contained in the introductory part of the BGB (articles 7 to 31).

It was first possible to learn the trend of popular opinion when the draft of the code was considered in the Reichstag. To be sure, there had been opportunity for this even earlier. When the first draft had been published, it had been accompanied by an invitation for public criticism and public opinion had been aroused upon a few questions, for instance whether upon the sale of leased property the tenant's rights should be terminated (now sect. 571 ff.). But on the whole popular participation was slight until the deliberations in the Reichstag. In that body a forceful opposition with a definite philosophical basis made itself felt. With regard to some matters a struggle arose against the acceptance of the "alien" Roman law in preference to the indigenous Germanic law. A passionate controversy arose over civil marriage: the Center, the Catholic church party, wished to withdraw the control of marriage from state authority and restore it to the church. Partly arising from this controversy was the struggle over insanity as a ground for divorce. It was finally accepted by a vote of 161 to 133 (sect. 1569). As an example of the way passions can be aroused over relatively minor problems the question of the hares may be cited. The BGB recognizes a liability for damage caused by game; that is, the hunter is liable to a landowner for any damage caused to his fields in the pursuit of game (sect. 835). In the draft hares were included with other game. The Conservative party representing the interests of the great landholders demanded that hares be made an exception, but the other parties opposed it. The BGB representing the longing

of almost a century and the labors of more than twenty years almost foundered in this controversy. In the end the conservatives won: the hares are not to be found in the law.

After the deliberations in the Reichstag had been concluded the code was proclaimed by the emperor Wilhelm II on August 18, 1896, but in order to allow enough time for its contents to become familiar it was not to go into effect until January 1, 1900. At the same time a whole number of accompanying laws went into effect, for instance a law relating to the registry of land and a law relating to non-contentious jurisdiction. To bring them into agreement with the BGB other important laws, for instance the commercial code and the code of civil procedure, were radically amended. In all it was a very important code that was finally achieved in 1900.

The German civil code contains 2385 paragraphs and is divided into five parts; the first is an introductory general part and the other four relate respectively to the law of obligations, the law of things, family law and the law of inheritance. This represented the division of the Pandects, which was thus retained. Particularly great care was devoted to the general part. It is unique in the legislation of the world. In it many fundamental legal concepts are finely distinguished and raised to the rank of general principles, for example the concepts of manifestation of will, of contract, of representation. It is noteworthy that commercial law, for instance the law of partnership and joint stock associations, was not introduced in BGB but remained in separate laws.

A creation of the late nineteenth century, the German civil code bears unmistakable traces of its liberalism and individualism, although to be sure these trends were not allowed full expression. After its first draft and through the whole course of its parliamentary consideration the code remained a work of non-partisan scholarship; in this it differs from the much more "popular" Swiss civil code. It may be said, however, that the German civil code came into being at an unfavorable time. It stands not at the beginning but the end of a historical period and therein differs from the French civil code, which derived from the profound changes of the French Revolution and could give expression to the new points of view which had then been born. On the other hand, the BGB was fashioned in a period of social quiescence. As a consequence it escaped the problems of giant industry, cartels, trusts, trade unions, collec-

tivism and socialization which were just beginning to emerge.

Nevertheless, the German civil code has as a whole endured. Except for a few relatively unimportant changes it is still in full force and effect. Above all, certain celebrated elastic provisions have made it possible to adjust it to a large extent to new developments of cultural and social life. Thus, section 242 subjects the whole law of contracts to the requirement of "good faith" and section 826 makes it possible in the law of delicts to inquire beyond narrow technicalities into "good morals." What the highest court in Germany, the Reichsgericht, has been able to accomplish by virtue of these provisions and how the BGB has been adjusted to new economic needs are described in a work by J. Wilhelm Hedemann, *Reichsgericht und Wirtschaftsrecht* (Jena 1929). It is a particularly impressive fact that even the experiences of war and revolution have left the BGB almost untouched. Many voices have been heard loudly demanding its radical alteration—particularly those voices that demanded "socialization" of the whole of the German economy—but they have had little success. The three great guiding principles of the BGB, freedom of contract, private property and the integrity of family life, are still accepted. However, some reforms are contemplated. It is intended to better the position of illegitimate children; the wife is to be freed from the superior powers of her husband over her property; a reform of the law of landlord and tenant is planned in connection with the general reform of the land law. Above all, the law of contracts between master and servant has been almost relegated to desuetude as a result of the development of a modern labor law alongside the BGB. A general revision or a total abandonment of the BGB is quite beyond the realm of possibility.

The German civil code has also had a strong influence in foreign countries. Although it has nowhere been received in toto, wherever since 1900 attempts have been made to fashion civil codes the BGB has proved highly valuable in supplementing the ideas of codifiers despite difficulties in language and in modes of thought. The Swiss civil code of 1907 particularly is inconceivable without the influence of the German codification.

zu dem Entwurfe, 5 vols. (Berlin 1888, 2nd ed. 1897); *Protokolle zum 11. Entwurf*, 7 vols. (Berlin 1897-98); *Denkschrift zum Entwurf* (Berlin 1896). Of the enormously rich literature on the code itself the great systematic textbook of Enneccerus-Kipp-Wolff, *Lehrbuch des bürgerlichen Rechts*, 3 vols. (6th-12th ed. Marburg 1928-30) is the chief example. The following are representative handbooks: Lehmann, Heinrich, *Allgemeiner Teil* (3rd ed. Berlin 1928); Hedemann, J. W., *Schuldrecht* (2nd ed. Berlin 1931), and *Sachenrecht* (Berlin 1924); Lehmann, Heinrich, *Familienrecht* (Berlin 1926); Endemann, Friedrich, *Erbrecht* (Berlin 1923). The great commentaries are: Staudinger, I. von, 7 vols. (9th ed. Munich 1925-31); Planck, J. W. von, 5 vols. (4th ed. Berlin 1913-30); Busch, L., and others, *Das bürgerliche Gesetzbuch mit besonderer Berücksichtigung der Rechtsprechung des Reichsgerichts*, 5 vols. (6th ed. Berlin 1928). For general views: Hedemann, J. W., *Das bürgerliche Recht und die neue Zeit* (Jena 1919); Thur, A. von, *Grundlagen und Ausbau des bürgerlichen Gesetzbuches* (Strasbourg 1918). For historical background: Hedemann, J. W., *Die Fortschritte des Zivilrechts im XIX. Jahrhundert*, 2 vols. (Berlin 1910-30). Borchard, E. M., *Guide to the Law and Legal Literature of Germany* (Washington 1912) p. 56-97, contains a bibliography of literature in English on the BGB. English translations of the BGB are by Walter Loewy (*The Civil Code of the German Empire*, Boston 1909) and by Chung Hui Wang (*The German Civil Code*, London 1907).

GERONTOCRACY. Old men and women still possessed of their faculties have been dominant in social control and direction in all human societies. In civilized societies ancient and modern the dominance of the aged appears to be the consequence essentially of their greater experience and balance in judgment as compared with that of younger persons, chiefly as a result of their more extensive experience with facts, human nature and social techniques, their control of the family and the family wealth and therefore the aggregate social wealth, and the fact that they have established themselves in power to the consequent exclusion of the younger groups. In preliterate societies these same causes operate, but in addition the older groups are the repositories of the unwritten common law, of the magical group ceremonials and of the equipment of these ceremonials. The share of power or influence accorded aged women varies but is usually confined to domestic life and economic activities such as primitive agriculture and home manufactures which may be carried on by women. Women's share of influence does not appear to be correlated with matrilineal descent or matriarchy. In primitive gerontocracies women are universally excluded from the dominating councils of elders.

The term gerontocracy may be used to refer to the generalized dominance of the aged, but in historical descriptions of culture it should be confined to the designation of a formal pattern of social organization in which the aged are organized into councils of elders. It may be defined as the dominance through social control of the upper age class among peoples who have no form of the state, no political organization or political control. This formal patterning of society is limited in distribution and appears to be linked with secret societies, with warrior gradings and with other age grade or age class organizations. Formal age classifications exist more widely than gerontocracy. They are found among peoples who are highly organized politically, such as the Incas and some North American tribes.

Gerontocracy appears to be confined to the primitive culture strata of Negro Africa—surviving in west Africa on the margins of the development of the state or political control, dominant among the more primitive cultures of the Bantu of Kenya colony in east Africa—and to the Negroid and Australoid and mixed Negro-Australoid peoples of Melanesia and Australia. In these cultures an age classification of communities is found with the oldest age groups functioning as a council of elders. The elders do not exercise the functions of chiefs or rulers; they do not possess legislative, judicial or executive powers. They act in a quasi-judicial capacity as arbitrators of a sort when there is a dispute about damages in the community, and after hearing the facts they give their opinion on the common law and on what damages should be paid. They have no power to enforce the payment of the damages. Such gerontocratic political control may be sharply contrasted with complete anarchy—an absence of both political and age class social control—as represented, for example, by the Yurok Indians of northwest California and their cultural kin northward to the Columbia River.

Considerations of gerontocracy by historians of culture have been deficient inasmuch as they have been confined to the institution in its Melanesian and Australian varieties. Rivers writing in 1911 was apparently ignorant of the existence of gerontocracy in east Africa and his theories regarding the cultural linkages of the institution cannot be considered as valid until thoroughly reappraised in the light of the African data. Rivers, for example, makes much of the linkage of the dual social organization and

gerontocracy in Melanesia and considers these as intimately interrelated in development. But in Negro Africa there is no definite evidence of the present or past existence of the dual social organization. Loeb's comparative study of secret societies also indicates that the subject requires reanalysis in the light of the history of secret societies.

Judging chiefly from the distribution data, gerontocracy appears to be correlated in distribution with the Negroid race. Where dominantly Australoid peoples, such as the Australians, exhibit the institution it may be due to Negro influence and admixture. Negroid and Australoid races were once continuous in geographical range from the Pacific around the littoral of the Indian Ocean to west Africa; and with this racial continuum, according to Frobenius and others, there was an archaic culture continuum. This culture continuum may have included the institution of gerontocracy.

Whether gerontocracy is a form of social control more archaic than the state or political government is very problematical and must remain so until the institution is more carefully investigated.

GERRYMANDER is a term used to describe the abuse of power whereby the political party dominant at the time in a legislature arranges constituencies unequally so that its voting strength may count for as much as possible at elections and that of the other party or parties for as little as possible. To accomplish this design it masses the voters of the opposing parties in a small number of districts and so distributes its own voters that they can carry a large number of districts by small majorities.

The word gerrymander was derived in 1812 from the name of Governor Elbridge Gerry, who allowed a bill apportioning Massachusetts

into districts of fantastic shapes to become a law. By 1840 gerrymandering was the common practise in American legislation for the apportionment of seats in the national House of Representatives as well as in the state legislatures. As a result of gerrymanders the maps of congressional and legislative districts in some American states presented very striking irregularities in boundaries and in the shape of the different districts. For example, there was the famous "shoe string" district in Mississippi, about three hundred miles long and about twenty miles broad; a district in Pennsylvania resembling a dumb-bell; and in Illinois the "saddlebag" and the "belt line" districts.

Various attempts have been made to check the practise in the United States by means of legislation or other agencies. The reapportionment act passed by Congress in 1842 required the election of members of the House of Representatives from single member districts which should be composed of compact and contiguous territory. But while the districting remains in the hands of state legislatures great variations in construing the terms of the act must be expected. Proposals have been made to abolish the system of districts and choose all representatives at large, but this would result in the complete denial of representation to the minority party. Legal action against the gerrymander is often possible, but judges hesitate to interfere with legislative discretion in such political matters. Moreover, legal rejection of a redistricting statute may merely revive an earlier gerrymandered apportionment which is likely to be even more grossly unfair because of the shifts of population since its enactment. The referendum may sometimes be used to veto a flagrant gerrymander, as was done in Ohio following a Republican redistricting act of 1915. A campaign of education carried on while apportionment acts are pending in state legislatures would considerably check the manipulation of districts. The most effective remedy, however, and the one which has probably been the most important factor in the relative absence of gerrymandering in Europe is the substitution of proportional representation for the single member district.

Continental Europe has not been free from gerrymandering. Criticisms of *Wahlkreisgeometrie* in Switzerland were heard as early as the 1870's. When France changed from *scrutin de liste* to *scrutin uninominal* in 1927, the new single member districts were flagrantly gerrymandered by the commission in charge of districting. But

the possibility of gerrymandering has been largely destroyed by the widespread adoption in Europe of the list system of voting with proportional representation. Especially is this true of the German electoral system, which prevents the wasting of any votes by cumulating the surplus votes from the smaller electoral districts for use in connection with a list of candidates for the Reich as a whole.

'Tradition has no doubt been a factor of some importance in Europe. In many countries election districts largely follow traditional political or racial units. While the representation of certain groups has often been restricted, it has rarely been through the fantastic rearrangement of preexisting districts. The rotten boroughs of England, while somewhat similar to gerrymandering in their consequences, were a result not of any statute passed by Parliament but of the failure of Parliament to rearrange constituencies to meet changing social and economic conditions. The general redistricting of parliamentary seats in 1918 was effected by commissions composed of persons in whose integrity and independence the House of Commons had confidence. The principles they were to follow were laid down in advance by the House. There was no gerrymandering, since the practise is not in accord with English political traditions. Australian politics, on the other hand, have witnessed considerable apportionment manipulation, especially on the part of the Labour governments of Queensland and the anti-Labour governments of Victoria.

GERSHUNI, GRIGORY ANDREYEVICH (1870-1908), Russian revolutionist. He was originally interested in purely educational work

among the workers, but interference by the authorities and attempts by the political police to divert his legal activities to the service of their own ends caused him about 1900 to join the revolutionary movement. He was one of the founders of the Socialist-Revolutionary party, took a part in the drafting of its program and directed until his arrest in May, 1903, its terrorist activities, as head of its Fighting Organization. In 1904 he was tried and received a death sentence, which was commuted to life imprisonment. After escaping from Siberia in the fall of 1906 he participated in February, 1907, in the convention of the Socialist-Revolutionary party held in Finland and influenced its resolutions on the complex issues which faced the party in connection with its participation in the Second Duma. He remained politically active until he succumbed to disease.

Gershuni, an almost legendary figure to the Russian masses, was a man of uncommon will power, exceptional ability as leader and organizer and a rare sense of political realities. Unlike the terrorists of the earlier generation he did not regard terrorism as the principal means of overthrowing the government or even of forcing concessions from it. He maintained that with the spread of revolutionary sentiments political assassinations in retaliation for governmental repression were increasingly inevitable. They were a sheer waste of lives and energy when left to unorganized individual initiative; but if carried out under centralized control by a revolutionary party they could, through adequate preparation, proper timing of the attack and careful choice of object, be made very effective both in impressing public opinion and in disorganizing the repressive machinery of the state. Terrorism should be merely one of the manifold activities of the party, but for technical reasons it should be strictly isolated from the others, which although clandestine nevertheless involved comparatively wide contacts; it should be delegated to a special group, the Fighting Organization. He insisted that as soon as civil liberties were achieved the terror as a form of socialist action would have to be discarded.

ALEXANDER GOURVITCH

GERSON, JOHN (Jean Charlier de) (1363-1429), French church reformer. In 1395 Gerson became chancellor of the University of Paris and began to play an important role in French politics and in the ecclesiastical struggles over the schism. In 1415 he was sent to the Council of

Constance, where he took a prominent part in the most significant discussions. His opposition to the doctrine of tyrannicide, by which John Petit had justified the murder of the duke of Orléans by the duke of Burgundy, aroused the latter's enmity and forced Gerson to flee from Constance in 1418. In the next year he settled in Lyons, where he was active as a preacher, educator and writer.

Gerson tried to establish peace in church and state and was one of the leaders of the conciliar movement. His policy was always one of compromise. Just as he endeavored to reconcile scholasticism and mysticism into a reformed mystical theology he strove in his plan for the reform of the church to maintain and support the old system of church organization, eliminating its disadvantages by establishing the new doctrine of the superiority of the councils. As early as 1409 he attempted to prove in *De auferibilitate papae*, a treatise written for the Council of Pisa, the possibility of dethroning the schismatic popes, maintaining firmly, however, in opposition to Marsilius of Padua and William of Ockham, the doctrine of the divine basis of the papacy and the immutability of the ecclesiastical hierarchy and monarchy. A similar opportunism marks his speeches at Constance and his other works, especially *De potestate ecclesiastica et origine juris* (Paris 1417?). By making a distinction between the authority of an office derived from God and the frequently erring incumbent of the office he established the divine character of the papacy and of papal authority, at the same time emphasizing the superiority of the church and its councils over the papacy. Nevertheless, self-government should be the exception rather than the rule in church administration, for papal government has been ordained by God. Whenever it becomes necessary, however, the church may by its councils limit papal power. Upon this doctrine Gerson rested the possibility of the reform of the papacy.

Gerson's political theories also show a somewhat weak policy of compromise. In several great political speeches delivered before the French court he recognized as the ideal state a strong monarchy regulated by religion and reason and requiring the cooperation of the three estates, especially of the nobility. He believed in the independence of the temporal power in so far as it was not antagonistic to faith and the church. Because of his doctrine of the supremacy of the councils Gerson came to be regarded as an ardent proponent of Gallicanism. It is doubt-

ful, however, whether he would ever have subscribed to its principles.

GERTZENSTEIN, MIKHAIL YAKOVLEVICH. See HERTZENSTEIN, MIKHAIL YAKOVLEVICH.

GERVINUS, GEORG GOTTFRIED (1805-71), German historian. After abandoning a commercial career Gervinus became a student of F. C. Schlosser at Heidelberg. In 1835 he was appointed professor of history at Heidelberg and in 1836 at Göttingen. As one of the group of seven Göttingen professors who protested against King Ernst August's breach of the constitution he was deprived of his post and returned to Heidelberg. In 1848 he became a member of the Frankfort Assembly but soon resigned because of political disagreements.

Gervinus' work as a historian is characterized by a greater appeal to the political feeling of his nation than to the moral feeling of the individual. In the concluding volume of his *Geschichte der poetischen National-Literatur der Deutschen* (5 vols., Leipsic 1835-42, later enlarged under the title of *Geschichte der deutschen Dichtung*, 5th ed., 5 vols., 1871-74), which represents the first great attempt to combine the history of literature with a study of the political and social currents of the time, he expressed the wish that the nation, having reached the culmination of literary greatness with Schiller and Goethe, might turn to practical political deeds. A typical representative of constitutional liberalism, Gervinus was likewise one of the most ardent champions of federalism, considering the preservation of the particularism of the local German states within a strong federation (*Bundesstaat*) a solution of the national problem. This particularism, he believed, was inherent in the Germanic spirit and was largely responsible for the cultural development of Germany. The *Deutsche Zeitung*, which he founded in 1847, propagated these ideas and his *Geschichte des neunzehnten Jahrhunderts seit den Wiener Verträgen* (8 vols., Leipsic 1855-66) is based largely on the view that history is a development toward freedom and democracy. The appearance of the introduction to this work in 1853, in which these general principles were indicated, brought upon

him a charge of high treason and a withdrawal of his professorship. Gervinus disapproved passionately of the methods of Bismarck. He was full of indignation at the war of 1866 and he died not reconciled by the events of 1870-71.

G. Gervinus* (Berne 1922).

GESELL, SILVIO (1862-1930), German money reformer. Gesell lived for many years in Buenos Aires, where he became a wealthy merchant, and later spent some time in Switzerland, engaging in farming and writing. In April, 1919, he joined the Soviet cabinet of Bavaria as minister of finance. During the Argentine money deflation of the late eighties he developed the doctrine of "free money," the later version of which together with his plan of land reform inspired the movement for a "free economy." The movement, particularly vigorous in the early post-war years, included the Swiss and German Freiland-Freigeld Bund and similar organizations, which met at their first international convention in Basel in 1923.

Gesell's scheme of social reform is intended to eliminate non-labor incomes, such as interest and rent, the existence of which in the present system he attributes to the inequality inherent in the relationship between the buyer and the seller of commodities in the market. While commodities because of their perishability exercise a demand for money which cannot be delayed for long, money which is not spent for consumption purposes—funds which are saved and spent only when a surplus is realized thereby, or mercantile capital—can be withdrawn from the market without a loss in value. Because of this advantage the holders of money are able to command a premium which is not related to mercantile profit, a differential between the price paid to the producer and the true value of the commodity. When the prices at which merchants can sell fall and this differential disappears, mercantile capital withdraws from the market, a temporary breakdown of circulatory processes ensues and stocks deteriorate. The possibility of exacting such a differential, called by Gesell primary interest or exchange interest, imparts to money the characteristic of capital. Capital goods function as capital because they can be purchased

only for money; their production is restricted, so that their yield would not fall below the level of primary interest. In order to abolish primary interest Gesell proposed to eliminate the superiority of money over commodities by introducing "shrinking" money (*Schwundgeld*) which would weekly lose 0.1 percent of its face value, a rise in its purchasing power being prevented by a properly directed currency policy. Such money could not be withheld from the market; it would cease to earn primary interest and become free.

Gesell's land reform scheme is not so original. He proposed the nationalization of land and its leasing to the highest bidder. The rent received by the state would allow the payment of interest to the original owners and the gradual amortization of their capital. After this the rent revenue would be used to reduce taxes, to provide for mothers' pensions, old age pensions and the like.

GESHOV, IVAN EVSTRATIEV (1849-1924), Bulgarian statesman. Geshov attended Owens College in England and became one of the very few among the Bulgarian youth in Turkish times to possess a good education and a knowledge of world affairs. In 1872 he returned to Bulgaria to take an active part in the early struggles of his people against Turkish domination. He became prominent politically and was chief of the People's party (Narodna) for many years.

Geshov was appointed financial director of Eastern Rumelia in 1882 and a little later head of the National Bank in Sofia, which he helped to reorganize on the model of the best national banks in western Europe. In 1885 he introduced the postal savings banks. From 1894 to 1897 he served as minister of finance and gave most of his attention to the development of the cooperative movement and to encouraging the handicrafts, which for many years had been suffering from the industrial competition of the west. Under his direction the agricultural banks were reorganized in 1894. Geshov also reorganized the system of taxation in order to make it more equitable; direct taxes were reduced and the number of indirect taxes increased.

As a diplomat he stressed the pan-Slav point of view, insisting upon the maintenance of good relations with Russia, which he considered the protector of Bulgaria. He also tried to preserve the friendship of Great Britain. In the newspaper *Maritsa* he agitated for a Rumelia freed of the Turkish yoke; when Eastern Rumelia broke away from Turkey and declared itself united to Bulgaria in 1885 he made a fruitless visit to Copenhagen to persuade the Russian czar to give his approval to this move, which provoked a Balkan war. He also helped negotiate the ensuing peace of 1886. In 1911 he became prime minister and played a significant part in the formulation of the Balkan alliance. Although chief of Bulgaria's bourgeois party, he put through many measures that were beneficial to the masses. Despite his strong nationalist sentiment he was an outstanding pacifist, preferring on almost all occasions conciliation and compromise to drastic action.

GESNER, JOHANN MATTHIAS (1691–1761), German educator. As principal of the Leipsic Thomasschule Gesner reformed the study of ancient languages in a neohumanistic direction. While professor at Göttingen he founded a training school for teachers and a German society after the pattern of Gottsched's society in Leipsic. He put an end to rote learning of grammar and construing of texts, substituting "cursory" reading to quicken the growth of natural aptitudes, understanding, taste and ability of expression in one's mother tongue. He was an early advocate of the conversational method of learning languages.

Gesner organized the new German classical school (*Gelehrtschule*) and introduced classic authors in place of Christian Latin writers. He rejected the traditional humanistic formal discipline in favor of the new ideal of ethico-humanist culture and defended his ideas successfully against mechanical traditional humanism, Pietistic fears of classical learning and utilitarian fanaticism. He advocated the state school and a somewhat one-sided neohumanistic uniform elementary course of six years, designed for the needs of the merchant and laboring classes, an

intermediate course for the acquirement of polite culture and a higher course to prepare for the university.

GESTALT. The term Gestalt is a short name for a category of thought comparable to other general categories like substance, causality, function. But Gestalt may be considered more than simply an addition to preexisting conceptual principles; its generality is so great that one is forced to ask whether causality itself or substance does not fall legitimately under it; or expressed differently, whether the conception of causality as it has developed since Hume must not from the point of view of Gestalt be radically altered. The aspect of the universe to which the Gestalt category applies has occupied human thought since ancient times. Its essence is found in two main problems: first, the problem of the relation between a whole and its parts; and, second, the problem of the harmony, adaptedness or teleological perfection of certain morphological structures and types of behavior. In modern times the attempted solution of these problems has played a leading role both in biology and in certain philosophical disciplines like aesthetics, epistemology, logic and ethics.

The development of the new Gestalt concept occurred, however, in neither of these fields but in psychology. The reason is not difficult to discover. In philosophy, where consideration of the relevant problems had led to teleological as opposed to causal solutions, emphasis had come to be placed on a realm of being different from nature, at least from nature as treated by physics and chemistry. In biology, on the other hand, the same problems have been obscured and distorted by the Darwinistic concept of biological survival value, i.e. by the category of utility. The relation of the organism to its organs, the unity of structure possessed by each organ itself, the coordination of different organs in behavior and finally the adaptedness of behavior to the environment of the organism—all these facts were regarded through the spectacles of a category which may be described as teleology reduced to mechanism through utility.

Psychology late in the last century had not come under the strong influences operative in philosophy and biology. The decisive step in the new direction was taken by Charles von Ehrenfels ("Über Gestaltqualitäten" in *Vierteljahrsschrift für wissenschaftliche Philosophie*, vol. xiv, 1890, no. 3, p. 249-92), who pointed out facts of the utmost importance for psychology which had been more or less overlooked by the traditional schools. He asked, for example: When one hears a melody, what does one hear? The usual answer, tones, is insufficient for two reasons: first, if a melody consisting of six tones is presented to one person, he will hear more than the sum of what six persons would hear if each had been presented with one of the tones only; and, second, it is possible to change every tone of the melody by transposing it either into a different octave or into a different key, and yet the melody will remain the same. Therefore another answer to the question must be found, and this new answer must recognize the fact that in the individual's experience of the melody something else is real besides the tones. Since the chief element in the dominant psychological system of the time was the sensation and since the bulk of the sensation was considered to be its quality, Ehrenfels gave the name of quality to this new existential datum which was not a sensation. He called it a *Gestaltqualität*, which may be adequately translated as form-quality if one keeps in mind that the second part of this term emphasizes the existential aspect of the first and puts it thereby on the same level of reality with sensory qualities like blue, red, sweet.

At first no other claim was made for the concept of *Gestaltqualität* than that of its being a necessary psychological concept which must be treated on equal terms with the older ones but which could well be harmonized with them through treating the *Gestaltqualität* as something added to the original sum of sensory data. Unsatisfactory as this solution was, the great achievement of Ehrenfels in pointing out this new field bore ample fruit in the many experimental investigations carried on after 1895 by a small but vigorous group of psychologists at the University of Graz. They investigated properties of such wholes as possessed *Gestaltqualität* and developed the theory that they were of pure mental extrasensory origin created by a mental function which in opposition to current empiristic or reproductive theories they called the process of production. Seen in a larger frame this theory is vitalistic. It presupposes the whole mechanism

of sensations, each depending on its particular stimulus, the totality presenting no more than a mosaic of different sense impressions whose geometrical order is determined by the geometrical pattern of the retinal image. But unit formations and the shape of the units so formed are referred to a new factor which operates upon the sensory material. Thus two principles were believed to be operative in the perception of Gestalt phenomena: a mechanistic, machinelike sensory process and an extrasensory creative mental function.

Parallel to this development another, which was also to contribute to the modern Gestalt concept, was taking place in the study of behavior. Driesch, the biologist-philosopher, tried to explain action by two similar principles. The one, corresponding to the sensory mechanism, is the reflex mechanism; the other, corresponding to the production process, is what Driesch called the psychoid. The first supplied on a strictly mechanistic basis the material of behavior; the second regulated these reflexes and transformed them into coordinated and meaningful behavior. For Driesch the significance of behavior was one of the main conclusive arguments in favor of vitalism.

Such association with vitalism was, however, unfavorable to the development of the Gestalt idea. With a sound scientific instinct most psychologists and biologists shunned the introduction of vitalistic principles, with the result that the Gestalt idea, since it seemed to rest on a vitalistic foundation and certainly was not compatible with the traditional mechanism, was more or less neglected.

It was not until a full twenty years after the publication of Ehrenfels' original paper that the concept was further developed. The bearing of this new development is most easily understood when the relation between mechanism and vitalism is reconsidered. Both views involve the acceptance of the laws of physics which emphasize the machinelike nature of events, incapable of explaining the order of life or mind. To mechanistic eyes this order in events is nothing but the result of the blind reactions of "organismic machines" which have developed by trial and error and elimination of the unfit. Vitalism did recognize the reality of order but to explain it found it necessary to assume a new entity whose sole function was to create that order which was inexplicable on purely mechanistic principles. Thus logically vitalism needed mechanism. A solution of the vitalistic-mechanistic dilemma had to be very radical. It involved the acceptance of the

reality of form and order, but in order that these should be kept within a strictly scientific system the vitalistic force which was held to create them had to be rejected. Further, since the existence of such a force followed logically from the acceptance of form and order and of mechanism, it was the latter that had to be rejected.

The solution of the problem was indicated by Max Wertheimer and W. Köhler. The first statement of the new point of view came in Wertheimer's paper "Experimentelle Studien über das Sehen von Bewegung" (*Zeitschrift für Psychologie*, vol. lxi, 1912, p. 161-265). Both Wertheimer and Köhler pointed out that the idea that form and order can be produced only by preexisting machines which are as unconcerned about their products as is a lathe about the screws it turns out is a view totally alien to the developing science of physics. On the contrary, the world of physics reveals on every hand order arising from the specific properties of substances and processes in relation. In physics it is as unnecessary to introduce rigid constraints and pre-existing devices to explain orderly distribution in equilibrium or the transition from one state to another as it is to assume a supernatural force for this purpose. Spontaneous self-distribution of process, producing functional wholes, is a concept employed, if not expressly enunciated, by every modern physicist. Once this is recognized, the physics of organic processes need no longer be made in terms of machine controlled events. If brain processes show functional wholes produced by self-distribution of process, then the *Gestaltqualitäten* find a natural explanation. They appear as properties of spatially or temporally extended wholes. If these wholes are conceived as the mental correlates of physiological functional wholes aroused by the total stimulus constellation within a system with its own specific properties, it is possible to abandon at one stroke the sensory mosaic which nobody has ever observed and the process of production which is equally fictitious, at the same time retaining the reality of form. The scope of the Gestalt category is also enlarged far beyond the pale of the *Gestaltqualität*, since both the wholes themselves which have these qualities and the organization of the field into these wholes become aspects of one and the same problem (see CONSCIOUSNESS for further discussion of this psychophysical isomorphism).

From the same principles is derived an explanation of behavior, or action, with its characteristic of adaptedness. Only the most general

outline of the explanation can be drawn here. Briefly, the physical environment by affecting the sense organs sets up on the surface of the organism the conditions for a dynamic organization of process within the organism, the physiological counterpart of the world of direct experience. As a rule these distributions are not quiet or static but are under stress and contain energy which can be consumed in transforming them and relieving pressure. Millions of such organizations are, geometrically, equally as possible as the one actually in existence at any time; but according to a very general law of Gestalt theory, called the law of *Prägnanz*, the best possible equilibrium will be achieved, the actual organization will be as "good" as the conditions allow, with regard to closedness, articulation, consistency of the particular wholes on the one hand and of the total field on the other. The distribution of the stimulation on the sense surface, however, limits the "goodness" which the development of perceptual organization can achieve. Stresses always remain within the perceptual field and therefore the most frequent way of transforming this organization is through action. If one sees an "attractive" object one is actually attracted by it and tends to approach it, i.e. the organization of the psychophysical field contains a pull which is relieved by the movement of the body. Thus action is directly adapted to direct experience because it is regulated by it in a perfectly natural way. Thus according to the Gestalt concept meaningful behavior remains meaningful in theory, in contrast with the modern doctrine which tries to reduce behavior to a sequence of original and conditioned reflexes and to make it thereby devoid of any meaning or significance. Because of this new emphasis the Gestalt point of view will be of great and increasing value as it is applied to the whole field of social studies.

At this point the question may be raised: in what sense is the Gestalt idea a new category? Scientists had come to believe that they would know the whole universe if they knew the properties at each particular point at each particular moment. Now it is recognized that there are many things, such as the *Gestaltqualitäten* of Ehrenfels, which do not belong to space and time points but to larger space-time volumes. In other words, analysis if it wants to reveal the universe in its completeness has to stop at the wholes, whatever their size, which possess functional reality. Neither substance nor energy nor events prove to be divisible *ad libitum*. There-

fore, instead of starting with the elements and deriving the properties of the wholes from them a reverse process is necessary, i.e. to try to understand the properties of parts from the properties of wholes. The chief content of Gestalt as a category is this view of the relation of parts and wholes involving the recognition of intrinsic real dynamic whole-properties.

From this point of view causality falls under the Gestalt category. Hume attempted to reduce causality to mere factual sequences of point events. When it is said that A causes B, in reality no more is meant, according to Hume, than that A is followed by B. But here the example of the melody is in point: with equal right Hume might have said that there are the six tones, one after the other, and nothing between them. And yet a melody is not only something very different from the sum of the tones, it not only provides the tones with properties they do not possess outside the melody, but it also carries within itself its own law. The sequence of tones produced by a dog running over the keyboard of a piano is certainly no less causally determined than the sequence of tones in a melody, but its determination is of a different kind. These random tones are the incidental result of an activity which in itself may be coherent and unitary but which is not concerned with the production of tones; no tone therefore depends on any other tone, each resulting entirely from the dog's movements. In the melody, on the other hand, each and every tone gains its significance by its place in the whole, so that all are interdependent and come into existence at their proper moment because of that interdependence. Or, from another angle, even if chancicleer crowed every morning just before sunrise, this regular sequence would be no more a causal one than any other sequence. More generally speaking, two causal sequences, divisible into $A B C \dots$ and $A_1 B_1 C_1 \dots$ respectively, may occur in such a way that A is always followed by A_1 , B by B_1 and so forth and yet may remain absolutely independent. According to the only significant law, $A B C \dots$ form one series, $A_1 B_1 C_1 \dots$ another. Then law can no longer mean the mere statement of sequences but must refer to real functional wholes akin to melodies; scientific law must state, under the Gestalt category, the intrinsic properties of such spatial and temporal wholes. These wholes may legitimately be called meaningful, whereas the random sequence of tones is certainly perfectly meaningless, and thus again meaning pervades the applications of the Gestalt category.

To summarize: the Gestalt category wherever it is applied in science signifies the attempt to find within the mass of phenomena coherent functional wholes, to treat them as full primary realities and to understand the behavior of these wholes as well as of their parts, from whole rather than from part laws. To apply the category of cause and effect means to find out which parts of nature stand in the cause-effect relation. Similarly, to apply the Gestalt category means to find out which parts of nature belong as parts to functional wholes, to discover their position in these wholes, their degree of relative independence and the articulation of larger wholes into subwholes. Since most wholes are organized into more or less independent subwholes, each larger whole may ultimately be proved to be a subwhole of a still larger one; and only the progress of science can show where each whole has its final boundaries or whether this final boundary does not coincide with the boundaries of the universe.

The significance of this new approach is indicated by the tendency among modern students in other fields to attack the same problem of the whole-part relationship and to reach similar although less far reaching solutions. In biology C. M. Child has tried to derive morphological development as well as behavior from physiological gradients, i.e. from relevant, non-atomistic properties of the systems. In German psychology several schools have developed Gestalt concepts, all differing from the Gestalt theory by an ultimate dualism. A good account of these and of the older attempts may be found in a paper by Egon Brunswik ("Prinzipienfragen der Gestalttheorie" in *Beiträge zur Problemgeschichte der Psychologie*, Jena 1929, p. 78-149). The basic tendencies in physics have been referred to. In philosophy particular interest attaches to the theories of Jan C. Smuts, whose principle of holism has many points of contact with Gestalt, although it is not quite clear how far he conceives of holism as in nature and how far as a principle above nature; and to the philosophy of Whitehead, whose searching analysis of physics and metaphysics results in conclusions very similar to those of the Gestalt theory although his ultimate metaphysical solution seems to be different.

GHAZZĀLĪ, ABŪ-HĀMID MUHAMMAD IBN MUHAMMAD AL-TŪSĪ AL-SHĀF'Ī AL- (1058-1111), Persian philosopher and religious reformer. Al-Ghazzālī studied law at an early age and became the leading disciple of the Imām-el Haramayn. After the latter's death he taught canon law at the Academy of Nizām-al Mulk in Bagdad. At that time he tended toward skepticism, but after a study of the various schools of Muslim thought experienced a religious conversion and accepted the mystic doctrines of Sufism. In 1107 after a number of years passed in travel and retreat he was recalled to teach at Naysābūr. Finally he returned to his native town, Tūs, where he founded a school for jurists.

Al-Ghazzālī has related in his vivid autobiography, the *Munqidh* (French translation by Barbier de Meynard in *Journal asiatique*, 7th ser., vol. ix, 1877, p. 5-93), how he was struck by the waning of faith and religious sentiment in Islam and consecrated himself to the task of reviving the dying religion. This decadence he considered due primarily not to the political confusion of the period but rather to the wrongful use of reason in the problems of metaphysics and religion. He therefore attacked the neo-Platonic tendencies of the Hellenizing scholastics, such as Fārābi and Avicenna, in his celebrated work the *Tahdūt* (The overthrow of philosophers, Cairo 1303). In it he pointed out the vanity and futility of pure reason and claimed to prove that all scholastic argument was fraught with error and incapable of proving the most fundamental truths, such as the existence of a creator. In various writings al-Ghazzālī also protested against the school of the rationalist theologians, called Mutakallims, partisans of scholastic argumentation, or *Kalām*. He declared that reason as the basis of proof was adapted only to the highest intellects and not to the mass of the people and that religion and law must therefore be founded upon education, imitation and custom. He himself wrote for popular use a voluminous treatise entitled the *Ihyā* (The resurrection of the religious sciences, 4 vols., Cairo 1312), the clearest and most adequate expression of orthodox Is-

lamic theology. In it he expounded the principles of religion, morality and mysticism, depending only upon the traditional proofs and upon sayings or anecdotes relating to the most respected characters in the theology of Islam. The section on morality explains what ethical habits and customs should be followed in various social situations and analyzes the evil passions with much acumen. The section on commercial law discusses the various types of contract and gives an excellent analysis of the theory of sales. The mystic element, while very subtle, is comparatively restrained. The *Ihyā* established Mussulman orthodoxy at a time when there was a definite need for clearly stated beliefs; it has been an important factor in the permanence and stability of Islam.

GHETTO. The origin of this term is a matter of dispute. The most popular theory is that it derives from the Italian *ghetta*, meaning cannon or casting factory. It was presumably first used to describe a quarter of Venice which was situated near such a factory and which in 1516 was enclosed by walls and gates and declared to be the sole part of the city open to Jewish settlement. Other theories are that the word derives from the Italian *borghetto* (a small, negligible section of a town) or from the vulgar Italian *guetto*, or *guito* (a filthy creature), or from the German *Gitter* (bars). The assumption that it derives from the Hebrew *get* (indicating separation, segregation) is unwarranted, since except in some documents at Rome that term is not one of the many synonyms used in the Hebrew records to express such meaning. In any case, the institution antedates the word and the latter is used currently in several ways. It indicates not only the legally established, compulsory ghetto (a section of a city in which all Jews must reside, other quarters being closed to them, at certain hours even for transit) but also the voluntary congregation of urban Jews in a separate quarter, a phenomenon known in every land of the Diaspora centuries before compulsion was exercised and still common. By analogy the word is currently used to describe similar quarters of non-Jewish groups. This usage is justified by the

fact that the rise of the Jewish ghetto is basically similar to the rise of quarters of other groups differing in language, religion, race or general culture from the surrounding majority population, such as immigrant quarters, Negro quarters in American cities, European quarters in Asiatic cities, native quarters in South African cities; or even quarters of occupation groups, such as those of guild members in mediaeval towns.

When Christianity first spread to western Europe, not only Jews but also Christians had separate quarters, such as the catacombs. With the Christianization of the Roman Empire the position of the Jews as an alien group became more marked than before and they tended to segregate as much because of centripetal tendencies as because of external pressure. The establishment of a separate Jewish quarter facilitated their religious functions, for example, the observance of dietary laws and frequent prayer in the synagogue, as well as social intercourse within the group and simplified not only inner communal administration but also the satisfaction of administrative requirements of municipal authorities. In every country, even where the legal ghetto was non-existent, there arose separate Jewish quarters. In mediaeval Germany such a quarter was called *Vicus judaeorum*, *Judengasse*, *Judenviertel*, *Judendorf*, *Judenstadt* and, much later, ghetto; in England, Jewry; in France, *jui-verie*; in Spain, *juderia*; in Portugal, *judiaria*; in Provence, *carriera*; in Poland, *zydowskie miasto*, *dzielnica zydowska*, *ulica zydowska*; in North Africa, *mellah*. The only surviving legal and compulsory Jewish ghetto in the world is the *mellah* in Morocco.

The earliest known appearance in law of this tendency toward segregation is the grant of Rudiger, bishop of Speyer, who in 1084, in order to attract Jews to the city and thus "add to its honor," gave them the right to have a separate residential quarter where "they might not be readily disturbed by the insolence of the populace." Similarly the Jewish quarters in Toledo, Seville and Valencia from about 1200 to about 1400 were conceded to afford protection against attack and to facilitate the organization of communal life. It is clear that the ghetto was valued by its inhabitants. One community for many years commemorated by a special ritual the anniversary of the establishment of its ghetto; several communities which lost their ghettos repurchased them; when the dawn of the modern era in western Europe threatened the existence

of legal ghettos conservative Jewish elements lamented and resisted the dissipation of the atmosphere in which they were comfortable and best able to perpetuate group solidarity and their domination of the solidary group. In brief, while compulsory ghettos were known in a few places in Germany and Sicily before the fourteenth century, the institution was first substantially developed by the autonomous action of the Jews without the desire of the general population or the authorities and only later did it become a form of discrimination and persecution.

The transforming of the ghetto into a compulsory institution caused no great change in the geographical distribution of the Jews, since the majority the world over had of their own accord settled closely together. Nor was the creation of a geographical boundary the prime purpose of making the ghetto compulsory. The goal was to establish by means of a geographical ghetto a social ghetto; to crowd the Jews out of central business locations; to push them into small side streets and thus to limit their opportunities in commerce, handicrafts and competitive activity in general. The compulsory ghetto spread from southern Italy to central and eastern Europe. All ghettos—beginning with those of Rome, Venice, Turin, Florence, Pisa, Ferrara, Genoa, Mantua, Benevento and Naples and including those of Avignon, Carpentras, Vienna, Prague, Frankfurt, Cracow, Posen, Vilna and Sandomierz as well as such Russian cities as Kiev and Moscow, where no Jews might dwell under any circumstances and where those categories of Jewish merchants allowed to visit at stated periods were forced to stop at designated hotels the doors of which were locked at night—despite differences due to geographical isolation, variation in moral codes, religious persecution and juridical restrictions, served one general purpose: all eliminated or limited the participation of Jews in commerce and handicrafts and weakened their competition.

The compulsory residential restrictions laid down by the Venetian senate in 1516 did not prevent Jews from playing an important role on the Bourse (then perhaps the largest in the world) or from participating in commerce, especially with the Orient, or from organizing trading firms in partnership with Christians. But merchants and traders formed a negligible percentage of the ghetto population, the great proportion of which became impoverished because of its isolation. In 1388 the Council of Valencia decreed that Christians dwelling in the Jewish quarter should move out and in 1480 the Cortes, on the

grounds that Christians were debased by living beside Jews, decreed that the latter must live in a segregated section. In Portugal a special compulsory Jewish quarter was designated in every section which counted more than ten Jews among its population; the gates were locked every evening at vespers and Jews who returned after closing were fined and often subjected to corporal punishment.

The signal for general segregation of the Jews in a locked ghetto was given by Pope Paul IV in 1555 in the bull *Cum nimis absurdum*, and the compulsory ghetto was in general a product of the sixteenth century. The thesis of the bull was that it is an impossible absurdity for accursed Jews to live openly among Christians, to purchase real estate or to employ Christian servants. It ordered the establishment of ghettos in all cities of the Papal States. Even in the ghettos Jews were prohibited from owning houses and had to wear a mark of identification. The Roman ghetto, down to its abolition in 1870, was the filthiest example of the institution. It was situated on the low bank of the annually flooded Tiber, an unhealthy section where impoverished Jews had long lived. The entire Jewish population was confined within brick walls; the gates were kept locked the entire night and late comers were penalized with lashes and a fine. Conditions might vary somewhat with changes on the papal throne, but they were seldom ameliorated by any action of the College of Cardinals or of the inquisitors. A mountain of laws was reared to regulate every movement of Jews within and without the ghetto, to decide in which trades or handicrafts they might engage and the like. As a result of this restriction of activities the community became so impoverished as to be unable to pay taxes, and by 1647 its indebtedness had mounted to 167,000 scudi (approximately \$100,000). This picture is in a general way characteristic of the situation in all ghettos.

The religious argument, widely and effectively employed in the campaign to segregate the Jews, was but a rationalization of a more basic conflict. In the sixteenth century the growing Christian bourgeoisie, organized in merchant and craft guilds, embarked upon a systematic struggle against feudal barons, bishops, kings and emperors to obtain wider municipal autonomy and commercial freedom. The Jews, thanks to the protection of feudal lords, had in the preceding period of flourishing trade recovered from their sufferings of the eleventh to the fifteenth centuries and were prospering through what was

virtually a monopoly on the trade of central and southern Europe. The creation of the compulsory ghettos, like the exclusion of Jews from many occupations, such as money lending, trade in specified merchandise and handicrafts, was part of the organized effort of the maturing Christian bourgeoisie to eliminate the Jews as competitors. Moreover, since the Jews paid over the best portion of their profits to their feudal and royal patrons either as taxes, loans or forced "gifts," the battle against Jewish merchants and traders was also a part of the effort of the Christian bourgeoisie to free themselves from feudal overlords and to gain control of the municipalities.

The struggle against the Jews in Frankfort was typical. In accordance with an agreement, renewed quarterly, between the municipal council and that of the Jewish community the Jews had the right of domicile only in specified sections of the city. The size of the Jewish populace was limited; Jews were forbidden to compete with Christian merchants or members of craft guilds; they were prohibited from purchasing real estate; they were excluded from membership in merchant and craft guilds or from doing business in the open market and were forced to peddle from house to house or to sell in the ghetto. When they sold at rates lower than those prevailing in the open market, the populace preferred to buy from them rather than from the faithful, a fact which aroused hostility often culminating in pogroms. The Jews appealed for protection to the king, whose serfs (*servi camerae*) they were in legal theory. The opposition party, led by a lawyer, Nicholas Weitz, and an artisan, Vincent Fettmilch, in a memorandum to the king in 1602 challenged the royal prerogative over the Jews. The memorandum asserted that, while it was true that the Jews had previously been the property of the king, Charles IV had turned them over to the municipality and they were now the serfs of the city burghers, who proposed that they be expelled as criminals and their possessions be turned over to the municipality. In a countermemorandum the Jews sought to prove that the municipal council and the merchant and craft guilds had built a fence around them from which they had no egress and that they were forced to pay much higher taxes than others. In 1613 the burghers forbade all Jews who possessed less than 15,000 guildens to remain in Frankfort. They confiscated 10 percent of the possessions of sixty Jews, whom they drove from the city, and were on the verge of

driving out the remainder of the community when royal commissioners commanded that the persecution of the "royal serfs" cease, granted permission to the expelled to return and provided for implementing the agreement between the municipal and the Jewish councils. In 1614 the burghers, led by Fettmilch, perpetuated a pogrom in which many on both sides were wounded, the ghetto was ruined and 1380 Jews were driven from the town. Only then did the royal commissioners receive a command to arrest Weitz and Fettmilch. Two years later the commissioners led the Jews back to Frankfort in a formal procession, granted them special military protection and settled them anew in the ghetto.

Within the ghetto poor Jews were practically prisoners, but the rich received special privileges or bought a modicum of freedom with money. Some streets were reserved for wealthy Jews, others for the poor. The ghetto of Venice contained large Jewish merchants and manufacturers, and according to Luzatto approximately 4000 Christians were employed in the Jewish factories there in 1638. In Vienna in 1753 there were seventeen families of rich Jewish liveried merchants, traders and bankers and some 350 Jewish cashiers, bookkeepers, agents, servants, teachers, rabbis and other retainers. At the end of the eighteenth century of the 3000 Jews in the Frankfort ghetto fifty-four paid taxes on sums exceeding 10,000 gulden, thirty-two on sums between 5000 and 10,000, and forty-nine on sums between 3000 and 5000.

The fact that ghettos were for the most part in the larger and more important commercial and industrial cities must have had a decided influence on Jewish occupational distribution. Statistics as to the occupational distribution of the Frankfort Jews, while meager, show that in 1694 there were 267 persons, or 70 percent of the total, in trade (textiles, clothes or money); nineteen, or 4.9 percent, were butchers or bankers; thirty-three, or 8.6 percent, were in the free professions; forty-eight, or 12.5 percent, were landowning and professionless; nine, or 2.1 percent, were unskilled laborers; and seven, or 1.9 percent, were beggars. In 1703 the figures show a slight decline in the first two categories and an increase in the third. The Rothschilds, Schiffs, Speyers, Wertheims, Gomperzes, Oppenheimers and Orensteins, all of whom played important roles in nineteenth century finance, arose from the ghettos of Frankfort and Vienna. They amassed their wealth during the wars of the seventeenth and eighteenth centuries and by the

beginning of the nineteenth century, although they remained in the ghetto without political rights, they had begun to play a significant role in the general economic and cultural world. They formed, however, but a small proportion of the ghetto population.

Since the ghettos were concentrated in the large industrial centers they experienced frequent increases in population through successive influxes. Despite its unfavorable living conditions the ghetto often offered better economic opportunities than did many provincial towns where unrestricted quarters were available. Population growth was not steady, however, being periodically interrupted by harsh persecutions. The Jewish population tables of Frankfort offer a rare insight into Jewish political history. They show between 1463 and 1569 an increase of only 790 over an original 110, between 1590 and 1690 an increase of only 1000 over an original 1000 and between 1709 and 1808 an increase of only 85 over an original 3019. The mortality rate per 1000 between 1675 and 1699 seems to have been about 41 percent and between 1750 and 1799 about 42 percent, indicating decisively that the population growth was due not to natural increase but to the influx of newcomers. While at the end of the sixteenth century approximately 2000 Jews were settled in Venice, in the middle of the seventeenth century there were, because of a large influx and despite persecutions, 6000.

In recent centuries the concentration of Jews in the largest cities of all countries has exceeded that of the general population. A third of the entire Jewish population of the world is concentrated in the fifteen cities of Europe and America having a population of 1,000,000; 6 percent of the entire population of these cities is Jewish. Here the Jews themselves have created voluntary ghettos, quarters of the city, where Jews constitute often as much as 80 or even 90 percent of the total population; in these districts the great majority of the city's Jewish population is to be found. In one district of Warsaw, for example, Jews comprise 94.4 percent of the population; in another the percentage is 78.7, in a third 63.1, in a fourth 59.4. In Vienna and Warsaw, each of which has twenty wards, about two thirds of the entire Jewish population is settled in four wards. In 1892, 75 percent of the Jewish population of New York lived on the East Side. Although the improved status of some immigrants has resulted in a certain amount of scattering, in some districts of the Bronx and Brooklyn the Jewish population totals between

80 and 90 percent of the whole. The Jews in the Bronx number 45.28 percent of the total population of that borough, and in Brooklyn 35.02 percent. In London in 1929 two-thirds of the 75,000 Jews in the city were concentrated in the East End and Stepney.

Although with the sharpening of class differences in the modern ghetto a certain proportion of the more prosperous Jews moves to a non-Jewish section, only a small group belonging to the upper class definitely breaks with Jewish surroundings and lives aloof from a Jewish environment. In some countries, for example, Italy and France, where the proportion of Jews to the total population is extremely small, members of the proletariat show a similar trend. On the other hand, when the Jews of the middle class attempt to make such a break, there occurs a mass exodus and a reconcentration of the same Jews in a new section of the city. This phenomenon of voluntary concentration is due to a complex of religious, national, social and economic reasons. Perhaps the most significant fact behind it is that wherever the wandering Jewish masses go they concentrate in special fields of artisanship and small manufacturing, i.e. in the occupations to which they have been historically bound, which do not require large capital investment and involve no great physical exertion. The occupational concentration of the mass of Jews, both employers and laborers, increases the tendency to residential concentration. In the wake of this phenomenon comes the concentration of Jewish middlemen, intelligentsia and all the other elements of a functioning community. Within such a community there arises a network of institutions (charitable, social, cultural, political) which, in turn, tend to stabilize and perpetuate the ghetto.

It has already been pointed out that conservative and dominant elements in the de jure ghetto communities resisted the break up of the ghetto threatened by the rise of the modern state. Similarly, conservative elements in the de facto ghettos of today resist the drift away from the ghetto and cultivate an atmosphere of animosity toward Jews who reside outside. On the other hand, Jewish liberalism, seeking to realize the theories of the French Revolution with regard to their position in the state, has not only worked to destroy the old but has disapproved the new type of ghetto. Historians of the liberal school tended to paint the mediaeval ghetto as an institution of unmitigated evil. The rise of modern Jewish nationalism was attended by a reaction

against this point of view. While some Zionists on the whole share liberal sentiments with regard to the ghetto, the so-called Diaspora nationalists have adopted a different attitude. Simon Dubnow's historical work in particular has served to document their view that the mediaeval ghetto had positive values for the Jewish community and that within its walls there grew up a communal organization, national solidarity and a cultural life which, while colored by the effects of walled isolation from the outside world, produced characteristic values of its own. These Diaspora nationalists demand an opportunity for autonomous life such as the ghetto partially provided and look to the new theory of minority rights as a basis for the development they seek.

GIANNI, FRANCESCO MARIA (1728-1821), Italian statesman and economist. Gianni was born in Florence. He was director of the customs in Pisa and was later promoted to the rank of senator in Florence and made superintendent of the silk industry. Gianni rose to eminence in 1766 when a grain scarcity menaced the country. Conversant with the works of Bandini, he

proposed the extension first to Siena, then to all Tuscany of free trade in grain originally granted to Maremma in 1738. On September 18, 1767, was promulgated the famous act by which Tuscany became the pioneer in the cause of commercial liberty. The grand duke Leopold placed great confidence in Gianni, gave him the rank of minister and followed his advice when he, elaborating a view first put forward by Hutcheson and commented upon by Hume, strongly argued that public debt was not truly a state debt but a sum of private debts from taxpayers to public creditors, in which the state acted only as an intermediate agency. Pursuant to this theory an edict of 1788 distributed the public debt among payers of land taxes. Gianni lived to see his work overturned after the ascension of Leopold to the Austrian throne. The Debt Redemption Act was recalled and in 1790, a year of food scarcity, he, as the author of free trade in grain, was branded as an arch enemy of the people; his house was sacked and he was obliged to escape to Bologna. For a brief period he was minister of finance under the French regime and he retired in 1801.

LUIGI EINAUDI

Works: *Scritti di pubblica economia, storico-economici e storico-politici*, 2 vols. (Florence 1848-49), with biography by G. Ponsi, vol. i, p. 1-7; *Governo della Toscana sotto il regno di S. M. il Re Leopoldo II* (Florence 1790), the celebrated budget report for the period 1765-89 said to have been written by Gianni.

GIANNONE, PIETRO (1676-1748), Neapolitan jurist and historian. In 1723 Giannone, then an influential jurist at Naples, published the voluminous *Dell' istoria civile del regno di Napoli* (4 vols., Naples 1723; ed. by Achille Mauri, 2 vols., Milan 1853; tr. by James Ogilvie, 2 vols., London 1729-31) with which he had been occupied for twenty years. The word *civile*, as his introduction states, was meant to designate a new conception of history finding its content entirely in "political matters . . . laws and customs." Considering Giannone's training and temperament, it was natural that in the actual working out of his problem he should devote his attention not to a narrative of political events but to the evolution of the legal, administrative and constitutional structure of Naples. As a record of the life of the nation *Dell' istoria civile* inevitably shows the limitations of the juristic point of view, but by introducing into the province of the

national historian a mass of material hitherto neglected it marked an innovation in historiography. In spite of Giannone's more or less extensive plagiarisms in particular passages the originality of his conception remains undiscredited. The laws and institutions of Naples had emerged during the kingdom's long struggles to free itself from the hegemony of the church, which claimed feudal suzerainty over it; and the problem of the relations between church and state—in Giannone's day still the gravest concern of the Neapolitan government—was uppermost in his mind. Upon the framework of the historical manifestations of this problem Giannone pinned his history. The spirit pervading *Dell' istoria civile* was plainly anticurialistic. Reducing the basis of ecclesiastical temporal power from divine right to merely "human titles" he vigorously championed the principle that the church should be subordinate in all except purely spiritual matters to the civil and lay elements in the state. Thus he heralded and helped prepare such great movements in defense of the rights of the state as Febronianism in Germany, Josephism in Austria, Leopoldism in Tuscany and the ecclesiastical legislation of Charles III's minister, Bernardo Tanucci, in Naples. In response to *Dell' istoria civile* the Neapolitan church excommunicated Giannone and forced him into exile. Finding refuge at the Viennese court of Charles VI, he remained in Austria until 1734, when he was lured back to Italy by the hope that the Bourbon Charles III, recently ascended to the Neapolitan throne, would protect him. His hopes proved vain; after many wanderings he was treacherously arrested by the king of Sardinia and kept a prisoner in the fortress of Turin for the remaining twelve years of his life. Shortly before his imprisonment he had completed the *Il triregno* (1736; first published 3 vols., Rome 1895), a doctrinal formulation of his religious views, which in the years since the publication of *Dell' istoria civile* had progressed from anticurialism to radical anticlericalism.

Munich 1925) p. 276-78.

GIANNOTTI, DONATO (1492-1573), Italian political theorist. Giannotti was active in the republican government of Florence which was established after the political changes of 1527, when the city revolted against the domination of the Medici. He was chosen secretary of the Dicci di libertà e pace, the supreme council, and maintained to a certain extent the tradition that the Florentine secretaries were political theorists as well. After the fall of the republic he went into exile, living many years in Venice.

In 1527 he wrote *Discorso sopra il fermare il governo di Firenze*, which he dedicated to the gonfalonier of justice, the chief magistrate of Florence. In it he named the principal aspirations of various groups in society; the mass desires liberty, a smaller group aspires to honor, while absolute power is the ambition of certain individuals. From this he concluded that it was necessary for the Florentine Republic to have three organs of government to satisfy these aspirations: a grand council recruited from the masses for the first; a senate chosen from the aristocracy for the second; and for the third a gonfalonier appointed for life. He thus showed himself an advocate of a mixed constitution, in which were to be fused the principles of democracy, aristocracy and monarchy, a fusion which the Greek political philosophers had ardently desired and which Renaissance thought had taken up and adapted to the conditions of the reestablished contemporary city states. Giannotti developed this same theme on a larger scale in a more comprehensive work written during exile, *Della repubblica fiorentina*, in which, using Machiavelli's *Discorsi* as a model, he intermingled theoretical observations with historical examples and criticism of existing governments. He reaffirmed the need of mixed government on the grounds that since there are different social classes and since therefore the desires of the classes forming the body politic are different "it is necessary to bear in mind these desires so that each part may be satisfied," because it is only thus that a stable social order can be established. On this basis he gave his judgment of the Florentine republican experiment of 1527 and disclosed the weaknesses which in his opinion had caused its fall. It is interesting to note that like Machiavelli he was an advocate of a citizen militia, recruited by districts, which would elect its leaders from among its members and in which he had much greater faith than in the mercenary forces. Another work of Giannotti, *Della repubblica de Veneziani*

(1540), written in dialogue form, in which he held that the aristocratic government of the Venetian Republic was the embodiment of the "mixed" regime, is more an exposition than a critical study. Giannotti was also the author of several literary works.

GIBBINS, HENRY DE BELTGENS (1865-1907), English economic historian. Gibbins was born at Port Elizabeth, Cape Colony, and educated at Bradford Grammar School and Wadham College, Oxford. While still an undergraduate he became interested in social and economic questions, and at the age of twenty-five he published his best known work, *The Industrial History of England* (London 1890). He was ordained deacon in the Church of England in 1891 but adopted the profession of schoolmaster, serving as vice principal of Liverpool College between 1895 and 1899 and subsequently as headmaster of King Charles I School, Kidderminster. Gibbins' later works, *The History of Commerce in Europe* (London 1891), *English Social Reformers* (London 1892, 2nd ed. 1902), *British Commerce and Colonies* (London 1893, 3rd ed. 1899) and *The English People in the Nineteenth Century* (London 1898) added little to his reputation. His *Industry in England* (London 1896, 7th ed. 1912) was substantially an expansion of the *Industrial History*.

None of Gibbins' work can be said in any strict sense to have been based on research; he was essentially a popularizer in the best meaning of the term. Written at a time when little attention had been paid to the subject, his *Industrial History* passed through twenty-seven editions within thirty years. It was widely used in the schools, but it appealed especially to the working men's classes which were then springing up, and in which industrial history was probably the subject most generally studied. Of the two different interpretations which had been recently propounded by William Cunningham and J. Thorold Rogers, Gibbins adhered to that of Rogers, with whom he had come into personal contact and from whom he had received much encouragement. While Rogers' teaching can be

traced throughout the *Industrial History*, it becomes particularly evident in Gibbins' accounts of the decay of the guilds and of the relation between the Black Death and the Peasants' Revolt and in his presentation of the golden age which had been destroyed by the greed of landlords or the unscrupulousness of industrialists. He asserts that the change from domestic to factory production was "sudden and violent" and draws a highly colored picture of the evil caused by the industrial revolution. On the whole Gibbins did not change his grounds in the successive editions of the book, although he did attempt to rebut the charge that he wrote with animus against landlords. The current edition (28th ed. London 1926) has been pretty thoroughly revised by J. F. Rees, who offers a quite different interpretation of some periods, particularly of the fourteenth and sixteenth centuries.

J. F. REES

GIBBON, EDWARD (1737-94), English historian. Gibbon's intellectual development may be summed up in four principal phases or turning points, each of which materially influenced the conception, plan and execution of his life work, the *History of the Decline and Fall of the Roman Empire* (6 vols., London 1776-88; new ed. by J. B. Bury, 7 vols., 1909-14). These turning points are: his precocious acquisition at about the age of fifteen of a great store of historical information which although unsystematic and unsupported by other studies furnished the inspiration of his subsequent career; his conversion to Roman Catholicism while a student at Oxford in June, 1753, and his reconversion to Protestantism at Lausanne, Christmas, 1754—a premature intellectual crisis that inflicted a permanent lesion on his mind, destroyed his interest in dogmatic religion, drove him for moral support to deism and infused all his later utterances on the Christian religion and the Christian church with a chronic bitterness; his sojourn from 1753 to 1758 at Lausanne, where under the care of a Swiss pastor, M. Pavillard, he laid the basis of a sound Latinity and thereby provided himself with a key to unlock the history of Rome and a passport to serious historical research; his visit to Rome in October, 1764, during which came the moment of illumination in the light of which he discerned the true scope and drift of his studies and formulated the plan of his magnum opus.

Historiographically Gibbon belongs to the

eighteenth century rationalist school of historians that arose with Bolingbroke, Voltaire and David Hume. The aim of this school was to liberate history from the incubus of supernatural interpretations and to supersede the old chronicle method of writing by a reasoned philosophical narrative based upon a critical examination of the authorities and the cultural value of the evidence. Utility was the objective, scholarship merely the means to the end. But although Gibbon was undoubtedly affiliated with this movement in his contempt for the *compilateur grossier* who did not write *en philosophe*, he held no brief for its leading doctrine that history is "philosophy teaching by examples." His scholarly instincts and training led him to a better understanding of the historian's function and technique. Laying great stress on accuracy, design, justness of perception and, above all, the correct appreciation of the causal connection between events he links himself with the rigorous historians of modern times.

The motif of the *Decline and Fall* is decay. In Gibbon's eyes European history from the age of the Antonines to the downfall of the empire in the west is a record of immense and steady retrogression. His analysis of the causes of the phenomenon is inadequate, his account being mainly descriptive and panoramic; but he is inclined to attribute the disaster, partially at least, to the triumph of Christianity and describes the rise and progress of the church with a thinly veiled hostility. At the same time he is fairly cognizant of other operative causes—military, social, economic—and in the last resort suggests that possibly the principle of decay was inherent in the organism from the start. Probably the weakest part of the work is that which deals with Byzantine history from Leo the Isaurian to Basil II, a period falsely represented by Gibbon as one of uniform corruption and decline. It should also be noted that many of the authorities on whom he relied have now been discarded as untrustworthy. But as a narrative history of the greatest event in the world the *Decline and Fall of the Roman Empire* is, and probably will remain, unsurpassed.

GIBSON, JOHN BANNISTER (1780–1853), American judge. A justice from 1816 to his death and for twenty-five years of that period chief justice of the Supreme Court of Pennsylvania, Gibson performed an important task, to quote his own words, “in building up a new system, in part on the model of an old one.” He combined a deep seated respect for the essential features of the common law of England and of English equity, as developed by the great English chancellors Hardwicke and Eldon, with a sense of the needs of a pioneer society and the advancing claims of democratic theory. Although his influence upon American law was exercised through his judicial work exclusively, he is entitled to rank as a leader in the American reception of the common law and equity system of England. Yet he escaped something of the blind reverence of Story and Kent for special doctrines of the English chancery based on the peculiar structure of eighteenth century society. The difficult problem of enforcing equitable principles through legal forms without the full equipment of equitable remedies, which was for more than a hundred years a peculiar feature of Pennsylvania jurisprudence, may have caused some aberrations in Gibson’s judicial thinking upon the nature of equity and equitable relief. But upon such a crucial issue as the relations of the forms of remedies to substantive rights Gibson recognized that “the drapery of the action” was not a matter of prime importance and that in many respects the writs and pleadings of the common law were “worn out machinery.” In the field of constitutional law he is remembered by the reasoning of a dissenting opinion in which he held the judiciary to be without power to declare void an act of the legislature, because of conflict with the state constitution—a position later abandoned with characteristic honesty and practical common sense. Perhaps some of his phrases have caused later judges to stray; for instance, his characterization of a negotiable instrument as “a courier without luggage.” But his benevolent personality and amiable temper, combined with an unusual gift for clear, vigorous and epigrammatic expression, served with his learning and broad culture to make him the most conspicuous of the chief justices of his commonwealth. He merited the praise that he founded there “a liberal, progressive jurisprudence.”

GIDDINGS, FRANKLIN HENRY (1855–1931), American sociologist. Through the influence of his teaching of sociology and the history of civilization at Columbia University, Giddings was one of the founders of sociology in the United States. Many of his works are polemical essays written in the journalistic tradition which he acquired as editorial writer on the *Springfield Republican* and the *Springfield Union* before entering upon his teaching career. These writings reflect Giddings’ social philosophy better than do his more academic works, in which he formulated a system of sociology composed of detailed logical categories. He was an insistent proponent of a rigidly scientific sociology, statistical in method and bordering on psychology and history in content; he was inclined to base his own judgments, however, on immediate impressionistic reflections.

The keystone of Giddings’ sociological system was his doctrine of “consciousness of kind,” which he derived from Adam Smith’s theory of moral sentiments and from Herbert Spencer’s doctrine of evolution and which he reformulated in his later works as the doctrine of “pluralistic behavior.” The essence of the doctrine is that individuals, by responding to common stimulation, by communicating and associating, by acting upon one another through suggestion, example and imitation, generate similar feelings and develop likemindedness. From an awareness of these likenesses and of contrasting behavior consciousness of kind or type arises which converts gregariousness into discriminative association and herd habit into norms and elements of custom through which society by using social pressure maintains social cohesion and perpetuates the adequate.

Giddings’ idealization of the social stability arising from likemindedness led him to oppose mass immigration, to regard large cities with their heterogeneity of population with distrust and to condemn radicalism as disruptive. He was an active opponent of socialism, regarding as its cardinal fallacy its principle that industrial derangements and their consequent tragedies can be prevented by planning under a socialist

state. Although he vaguely urged "social engineering" he held with the social Darwinians that in social as in natural selection the struggle for existence leads to the survival of the fittest and that the process is inexorable and beneficent. He defended what he designated a creed of socialized individualism, advocating that the successful, who were to him synonymous with the superior, should refrain from abusing their power to exploit the unsuccessful.

During and subsequent to the Spanish American War Giddings advocated an American imperialistic policy patterned after that of imperial Britain, which he conceived of as an ideal democratic empire. His intense chauvinism during the World War was expressed in part by an attack upon German political philosophy.

GIERKE, OTTO VON (1844-1921), German jurist. Gierke was one of the great exponents of the Germanistic point of view in the interpretation of German legal history—a point of view which as a pupil of Georg Beseler he embraced with passionate enthusiasm. He worked with tireless energy through most of his life upon two monumental works, *Das deutsche Genossenschaftsrecht* (4 vols., Berlin 1868, 1873, 1881 and 1913; vol. iv unfinished) and *Deutsches Privatrecht* (3 vols., Leipzig 1895, 1905 and Munich 1917; published as part of Binding's *Systematisches Handbuch der deutschen Rechtswissenschaft*). To these must be added his famous monograph, *Johannes Althusius und die Entwicklung der naturrechtlichen Staatstheorien* (Breslau 1880, 4th ed. 1929), in which he undertook to outline

Althusius' ideas within the whole context of European political theory. In *Das deutsche Genossenschaftsrecht* Gierke is more purely the scholar and theorist than in *Deutsches Privatrecht*, which partly grew out of his participation in controversies over the adoption of the German civil code, the first draft of which appeared in 1888. Gierke attacked the draft, which seemed to him unimaginative, because it gave little or no attention to codifying the developing Germanic elements of contemporary German law. Although he was not wholly successful he without doubt succeeded in strengthening certain fundamental Germanic trends.

Gierke's concept of *Genossenschaft* (cooperative association) influenced all his work. He did not give it a rigid definition but traced its evolution in contrast with its antithesis, *Herrschaft*. *Genossenschaft* is found where several human beings realize the ends of the group through some form of cooperation of their several wills, while *Herrschaft* is found where group ends are realized through subordination of the wills of the group members under one or several commanding wills. Gierke attributed to the Germanic peoples a particular aptitude for *Genossenschaft* and the freedom which it helps to maintain.

Apart from its theoretical implications the greatness of Gierke's work lies in the firmness with which it is rooted in the past of German legal history. In his undertaking to analyze the legal forms of association and cooperation among the Germanic peoples he profoundly influenced branches of law which are of particular importance at present, such as the law of joint stock companies, the law of cooperative associations and industrial law. Whoever wishes to do either theoretical or practical work in these fields must go back to Gierke. Upon public law his influence has been indirect but equally great, for his pupil, Hugo Preuss, was the drafter of the German constitution of 1919. With Gneist and Laband, Gierke is one of the important founders of contemporary German constitutional law. In general he has greatly stimulated the sociological approach to law.

CARL JOACHIM FRIEDRICH

Consult: Stutz, Ulrich, "Zur Erinnerung an Otto von Gierke" in *Zeitschrift der Savigny-Stiftung für Rechtsgeschichte, Germanistische Abteilung*, vol. xliii (1922) vii-lxiii, to which is appended a complete bibliography of Gierke's works; Schultze, Alfred, "Otto von Gierke als Dogmatiker des bürgerlichen Rechts" in *Jhering's Jahrbücher für die Dogmatik des bürgerlichen Rechts*, vol. lxxiii (1923) i-xlvi; Gurwitsch, Georg, "Otto von Gierke als Rechtsphilosoph" in *Logos*,

GIESELER, JOHANN KARL LUDWIG (1792-1854), German Protestant church historian. Gieseler was the son of a Westphalian pastor and studied theology at Halle. He taught at the universities of Bonn and Göttingen. Besides his wide scientific study, which covered the entire field of ecclesiastical and dogmatic history, he interested himself in practical social questions. He superintended the orphan asylum in Göttingen and founded a society to aid ex-convicts. In his numerous writings and particularly his chief work, *Lehrbuch der Kirchengeschichte*, he takes especial interest in the influence of the church upon the organization of society in the course of its development. As an important part of internal church history he treats the history of the internal constitution of society with special reference to the influence of Christianity upon the ethical conceptions of the people. Just before his death he was occupied with the question as to how far the church had transformed the social relationships existing in the Roman Empire. His realistic attitude is also seen in his avoidance of ideological constructions of history and his eagerness to let the sources speak for themselves. In his theological work he united critical discernment of the deficiencies of the records with a fine appreciation of the abiding worth of a living Christianity.

KARL VÖLKER

Important works: *Lehrbuch der Kirchengeschichte*, 6 vols. (Bonn 1824-57; pts. i-v, 4th ed. 1844-48, pt. v, 2nd ed. 1849), tr. by S. Davidson, J. W. Hull and H. B. Smith, 5 vols. (New York 1857-80).

Consult: Redepenning, E. R., "Gieselers Leben und Wirken" in *Lehrbuch der Kirchengeschichte*, vol. v, p. xliii-xlvi, English translation in vol. i, p. v-xiv; Baur, F. C., *Die Epochen der kirchlichen Geschichtsschreibung* (Tübingen 1852) p. 232-36.

GIESSWEIN, SÁNDOR (1856-1923), Hungarian sociologist, pacifist statesman and Catholic prelate. Giesswein began his career by the study of Assyriology and comparative philology but later turned his attention to the philosophy of history and sociology. As a forerunner of Paul Barth he believed that history contemplates the flux of things, sociology the achievement; and that just as the philosophy of history is the metaphysics of history, so social philosophy is the

metaphysics of sociology. In Giesswein's sociological system the milieu and moral and social ideas form the elements whose synthesis, the cultural idea, is decisive for the development of human society. He held that individuals and society condition each other and found the reconciliation of socialistic and individualistic aims in the basic teachings of Christianity. His sociopolitical writings were the theoretical bases for his practical activity in parliament, to which he was elected in 1904, and in the foundation of the Christian Social party. Giesswein succeeded in founding ninety-eight Christian Social trade unions in Hungary, but because of their alignment with the clerical party of large landowners received no support from them for his program of agrarian and radical social reform. He later reorganized the Christian Social party, which abandoned him when he refused to cooperate with the counter-revolutionary reaction. With a few adherents Giesswein fought unswervingly for the democratic liberal tradition during the years of terror in Hungary. Even during the World War he was active in behalf of international pacifism. As member of the Central Committee for an Enduring Peace he made a report in 1915 in Berne on the idea of association in international law. In the militaristic atmosphere of post-war times Giesswein was the only scholar and politician in Hungary who entered the lists with courageous sincerity for international union and the supranational education of youth. He also took active interest in the Esperanto movement and in the struggles for the legal equality of woman and against alcoholism.

RUSZTEM VÁMBÉRY

(Vienna 1906-07); *Keresztényszociális törekvések a társadalmi és gazdasági életben* (Christian Social endeavors in social and economic life) (Budapest 1913); *A szociális kérdés és a keresztényszocializmus* (The social question and Christian Socialism) (Budapest 1914); *A háború és a társadalomtudomány* (The war and sociology) (Budapest 1915); *Soziologische und geschichtsphilosophische Bemerkungen zur Organisation der zwischenstaatlichen Beziehungen* (The Hague 1916); *Gerechtigkeit und Friede* (Pressburg 1918); *Háború és béke között* (Between war and peace) (Budapest 1921). *Consult:* *Giesswein emlékhőnyv* (Giesswein memorial) (Budapest 1925).

GIFFEN, SIR ROBERT (1837-1910), English statistician and writer on finance. Giffen worked for several years in a solicitor's office in Glasgow, where he also attended classes at the university.

After moving to London in 1862 he became connected with the *Globe* and the *Fortnightly Review*, and from 1868 to 1876 served as assistant editor of the *Economist* under Walter Bagehot. In 1876 he entered the service of the Board of Trade and remained with it until his retirement in 1897. He was chief of the Statistical Department and later the first head of the Labour Department. Through his work at the Board of Trade he was responsible for considerable improvements in official economic statistics; he also directed the first national census of wages in 1886 and played an important part in the reform of bankruptcy legislation in 1882. He was one of the founders of the *Statist* in 1878 and editor of the *Journal* of the Royal Statistical Society from 1876 to 1891.

Giffen's numerous statistical studies are models of clear exposition and of legitimate statistical inference. He paid little attention to the mathematical analysis of statistical data and was acutely aware of the limitations commonly inherent in quantitative material. In his studies of wealth and taxation he dealt particularly with Irish taxation, which he considered disproportionate to the wealth of the country. In his address on *The Progress of the Working Classes in the Last Half Century* (London 1884) he made the earliest competent attempt to measure the industrial progress in the United Kingdom in the nineteenth century. His *Growth of Capital* (London 1889) is one of the early estimates of national wealth which is still consulted. Giffen's contributions were not confined to statistics. His advice was frequently sought by various governmental bodies and some of his most valuable work is to be found in the printed memoranda and evidence submitted to royal commissions and committees. In these his wide acquaintance with financial subjects and his unusual power of accurate generalization from voluminous and complex evidence appear to the greatest advantage. Of his views on broader economic questions it is sufficient to observe that he was a free trader and that he was strongly opposed to bimetallism.

GIFT TAX. See INHERITANCE TAXATION.

GIFTS

PRIMITIVE. The voluntary offering of tangibles and intangibles designed to please or propitiate is a world wide practise. Gifts to children, to members of the family and friendship gifts, such as the friendship baskets given to one another by Pomo women, are usually expressions of affection. There are many ceremonial occasions on which gifts are given. Strangers, adopted persons, clans or tribes and newborn children are welcomed with gifts. At ceremonies of initiation into age societies and secret orders the gifts conferred sometimes go to the sponsor in return for relinquishing his place. Marriage gifts are given to the parents or clan of the bride and counter gifts presented by them. What is called marriage by purchase is often in fact gift and counter gift, for the women whose parents do not make satisfactory return gifts may be sent back.

Many types of service are rewarded by gifts, such as help of medicine men, acknowledgment of the offices of the opposite moiety in burial of the dead, as among the Kwakiutl, and services of the wife, as among the natives of the Trobriands. Propitiation gifts are offered at the commencement of a transaction, to be reciprocated in equivalence, as in the Solomon Islands, or in double value, as in the case of Kwakiutl transfer of a "copper." Gifts are often exchanged at the making of a treaty, as a pledge of good will; the original tokens, of wampum, became for the Iroquois and Algonquins the records of contract. Gifts to the dead often exceed the possessions of the dead persons when alive. Indians of southern California cast into the mortuary fire quantities of not always appropriate gifts. In many areas the ancestors may be thought to cling to the habitation, take part in the festivities and receive their share of the potlatch, as among the Kwakiutl. Offerings to supernatural beings have taken many forms: libations to the lares and penates among the Romans; burnt offerings among the Hebrews; prayer wands among the Pueblo Indians; human sacrifice among the Phoenicians and the Aztecs; mortification of the flesh, as in the torture of the Plains Indian's sun dance and the monastic haircloth shirt and scourge; and often conciliatory gifts given in the spirit of charity. Each offerer of these varied gifts ex-

pected greater counter gifts—life, health, happiness and spiritual power.

The practise of gift giving on seasonal holidays is widespread. It often takes the form of solicitation, as in the case of the asking festival of the Alaskan Eskimo and the gift begging ceremony of masked Russian children, which is similar to the Hallowe'en practises familiar in the United States. Holiday gift giving is especially prevalent in modern societies, where it is stimulated by commercial enterprise.

It is the law of the gift that it may not be summarily refused without giving offense, and a counter gift must be tendered in due season. The Maori of New Zealand class with theft failure to offer the return gift. Neglect to offer or refusal to take a gift is a declaration of war among Dyak tribes of Borneo. The Northwest Coast tribes acknowledge the potlatch to be "fighting with favors" in place of "war by deeds." Among the last named the wealth of a clan or moiety is gathered into the hands of a chief and transferred at a feast to the opposite moiety to "elevate the name." In due time this wealth is returned, during a potlatch of the latter, in double measure to be distributed among the members according to their original contribution. The transfer of blazoned mats in Samoa and the circulation of *Vaygu'a* in the Kula orbit in the Trobriands are comparable. The practise is not confined to the Pacific area and appears to have been the custom in ancient Ireland. Among the Kabyla of north Africa ceremonial gifts offered by invited guests at circumcisions and marriage festivities are announced by herald and recorded by scribe, to be returned with increase to the donor upon invitation to his fête. Gifts among the Plains Indians, for which no material return was expected, none the less lifted the giver in the esteem of his fellows, ultimately advancing him to the chieftainship. Striving for prestige and the feeling of the need of reciprocity are not absent in gift giving in modern societies.

The custom of gifts of welcome with their counter gifts developed into more or less organized journeys for the purpose of barter among the ancient Aztecs and more recently among British Guiana tribes. The modern use of shell money in the New Hebrides for the purchase of a pig has not replaced the obligation to reciprocate upon occasion with a pig. Nor is the opening or propitiation gift wholly obscured in the civilized practise of treating a customer. Acknowledgment for service passes into wage when the

honorarium assumes fixed value, whereas counter gifts call for enhancement, with the onus on the recipient to give more than he received.

Ceremonial gifts served both psychological and sociological ends, satisfying the ego through display and emulation, promoting fellowship and solidarity of the group, maintaining wealth in a state of flux, supporting religion and the primitive state, offering a substitute for war and cementing alliances.

H. NEWELL WARDLE

LAW OF GIFTS. A gift in the broad sense is any transaction with intention of gratuitously enriching another. Under this definition fall wills and legacies, but for convenience these have always been treated separately in the general category of "succession." The natural consequence ought to be that the subject of gifts covers only gratuitous enrichment *inter vivos*, but the Roman law and the common law contain the further class of gifts *mortis causa*. These are dispositions made in the form of a binding and irrevocable transaction *inter vivos*, i.e. delivery or formal promise, but containing conditions express or implicit which make them substantially equivalent to legacies.

Regarding the form required for a gift, it is useful to distinguish between executory and executed transactions or between a promise and a delivery of possession. The latter, when made of a movable object with the intention of transferring ownership, is valid in all systems of law; in the modern world a special document is required for the transfer of title to land. Although there is no difference in principle between the forms of making an executed gift and of transferring ownership for any other reason, all legal systems require more formality for a promise to make a gift than for one involving a *quid pro quo*. Subject to the *Lex cincia*, mentioned below, in classical Roman law a formal *stipulatio* was necessary to create an obligation; but one already existing might be gratuitously renounced in any manner, a distinction which has survived generally in Europe, although it does not obtain in the common law because of the influence of the doctrine of consideration (*q.v.*). In the *Corpus juris* Justinian allowed an action on any informal promise but provided that for an amount surpassing 500 *solidi* (about \$1500) the transaction should not be binding until "insinuation," a process similar to recording. For all gifts in modern Europe there is generally required a document signed before a notary. The

latter's presence is not necessary according to the latest code of Switzerland, and the French courts allow a gift if disguised as a document of sale. The common law follows much the same principles, demanding in lieu of delivery an instrument under seal or its modern equivalent. Difficulty has arisen, however, in connection with assets represented by such documents as stocks and bonds, savings bank books, insurance policies, warehouse receipts. There has been much controversy over the effect of gratuitous delivery of the document in these cases, and courts in England and America have taken varying positions. The Restatement of the Law of Contracts has recently declared for irrevocability if the document delivered is one the surrender of which to the debtor is necessary for enforcement of the claim. A growing tendency, evidenced by the Restatement, may be noted in favor of gifts where there is a "promissory estoppel," i.e. where the promisor ought to have foreseen that the promisee would change his position in reliance on the promised gift, as by traveling a long distance to visit the promisor, refraining from certain acts such as smoking for a certain time or the like. Furthermore, Anglo-American equity gives effect to any statement which can be construed as a declaration of trust.

Upon performance of the necessary formalities an unqualified gift *inter vivos* was irrevocable in classical Roman law, but Justinian instituted two exceptions: gross ingratitude of the donee or appearance of afterborn children of the donor. The content of the first exception is thoroughly if redundantly covered by the emperor, who provides that thereunder are comprised attempts on the donor's life, physical injury, atrocious insult or considerable diminution of his patrimony; the German civil code makes no attempt at definition in this respect in accord with the modern tendency to allow a reasonable margin of discretion in the application of legal rules. Except in France the donor alone, not his heirs, may revoke for ingratitude, whence a special exception has to be made in the event of his murder by the donee. The German and Swiss codes reject the exception of revocation in the case of afterborn children but allow revocation of enough to maintain the donor in his usual position if he unexpectedly and without fault becomes impoverished—an extension of the general rule of Roman law whereby the donor had when sued by the donee the *beneficium competentiae*, a privilege of somewhat the same import. In France the refusal of a donee to help

an impoverished donor is treated under the head of ingratitude—as an ingratitude on the part of the donee.

The great exception to the rule of irrevocability has been the gift *mortis causa*, i.e. upon condition that the donor predecease the donee. Perhaps before and certainly under Justinian such a gift was presumed to be freely revocable on account of its resemblance to a legacy, a principle which prevails in those parts of Europe not influenced by the French code and has even found its way into the common law, although that requires the contemplation of some particular danger or disease. The rule is abrogated in France, for, with the above two exceptions, according to the ancient customary maxim *donner et retenir ne vaut* it is there essential that a gift be irrevocable for any but the two ordinary exceptions. The wholesale reception of the institution of gifts *mortis causa* into the common law is a curious phenomenon. The policy of the statute of frauds, which abolished nuncupative (oral) wills, obviously applied to these gifts, which were substantially equivalent to legacies, being freely revocable by the donor even though the power of revocation was not reserved; the only express condition was that the donor should predecease the donee. The English courts, however, recognized them as a separate institution on account of their appearance as such in the earlier works of Bracton and Swinburne. These writers had followed Justinian's law as to their revocability but had strangely overlooked his provision that they must be made before five witnesses. The fact that they are formally gifts but substantially legacies is reflected in the various rules governing them; thus they need not be proved before the probate court as a will must be, but any principle not relating to the form of a will or codicil which applies regardless of the testator's intent, such as the rules of testamentary capacity or those taxing inheritance, has necessarily been extended to them in almost all times and places. To avoid difficulties of proof by its tax commissioner the legislature of Wisconsin provided that any gift made within six years of death should be conclusively held to be in contemplation of death, but this attempt was held unconstitutional in *Schlesinger v. Wisconsin* [270 U. S. 230 (1926)].

Among restrictions upon gifts in Roman law were those dependent upon the fact that the donee was in a position unduly to influence the donor. A Roman statute of 204 B.C., the *Lex cincia*, was evoked by the undue remuneration

exacted from their clients by the rich and powerful lawyers of the day. It apparently prescribed a criminal penalty for such persons and took the opportunity to hinder all gifts above a specified sum to others than relatives by requiring absolute execution, i.e. in effect delivery as well as formal conveyance for immovables; in the case of movables an additional six months must elapse. Although this legislation was obsolete under Justinian, its principle is evident in his "insinuation." Another limitation was contained in the statutes for *repetundae*, which made it criminal for a public official to receive gifts from those subject to his power; such gifts were conclusively presumed to be extortionate. This sweeping presumption no longer exists anywhere; the specific intent to induce the unethical conduct must always be proved. The most important prohibition of Roman law was that by which any gift between husband and wife was absolutely void. Its effect was considerably modified by Caracalla's provision that the transaction might convalesce on the donor's death, the purpose being to assimilate the case to the *Lex cincia*, according to which only the donor and not his heirs could avoid the gift, a principle which it will be remembered also applied to revocation for ingratitude. As may be seen from this tendency to desuetude, the policy behind the prohibition is not very clear and its genesis is probably to be explained historically. The ancient Roman marriage resembled that of the common law in that the wife had no personality or property of her own; hence gifts were out of the question. With the growth of the empire ordinary marriages were recognized, terminable at the will of either party and involving no change in the wife's status or property. It may have seemed unfair that the feminine parties to these reluctantly recognized unions should be in a so much more advantageous position to derive pecuniary benefit from the transaction. But since the wife's property was separate during the marriage, it is difficult to ascribe any importance in this connection to the freedom of divorce. No restrictions whatever on spouses in the matter of gifts now exist in Austria, Germany or Switzerland.

It may be concluded that the great disfavor originally shown to gifts has been gradually disappearing, and for this there is probably both a practical and a theoretical reason. Practically it is almost impossible to prevent gifts; if the donor does not wish to revoke, there is nobody else entitled to claim. It is of course possible to

make the act of giving criminal under certain circumstances; antitipping legislation may be mentioned by way of example. But experience has proved such laws unsatisfactory; enacted originally in quite a number of American states, they have been by now repealed in all of them. As for allowing revocation, such a course seriously impairs the security of transactions and tends to put the donee at the mercy of the donor. From the theoretical point of view there is little justification for the practise of nullifying gifts not induced by fraud or duress, apart from the institution of prodigality. Where such conduct is a ground for the appointment of a guardian, this would be a sufficient remedy except where the gift had been of all the donor's property, a transaction which when performed by a sane person is almost necessarily intended to be either a testament or declaration of trust in favor of the donee. At common law the appointment of guardians for spendthrifts was rejected as contrary to the genius of a free people; with perfect consequence that system has never had any special rules prohibiting gifts or allowing their revocation; only in the case of the donor's murder by the donee has it felt the need of a particular exception such as exists in European countries.

GILBERT, JAMES WILLIAM (1794-1863), English banker. In 1834 Gilbert became general manager of the London and Westminster Bank, the first joint stock bank established after the passage of the Bank Charter Act of 1833. Vested banking interests, including the Bank of England, threatened the success of the new bank with injunctions, lawsuits and adverse bills in Parliament, but Gilbert overcame all opposition. He was instrumental in enlarging the legal powers of joint stock banks and played an important role in the development of a form of banking organization which now completely dominates the field.

Gilbert also took an active part in the banking and currency controversies of his time. Although his name has been overshadowed by those of Tooke, Newmarch and Fullarton, on whose side of the battle he stood, his contribution is more imposing than may appear at first sight. To the arguments in favor of continuing the right of note issue by country banks he added the principle of periodic fluctuation. "The laws which regulate the issues of country banks," he said before the Select Committee on Banks of Issue in 1841, "are derived from the state of trade in the respective districts in which those banks are established, and I think those laws must be uniform in their operation because there are uniform fluctuations in each year." The circulation of the Bank of England was governed by the dividend payments on government securities, by the short term borrowing of the government and by the movements of bullion; these factors also tended to be periodic in their movements. Gilbert thought it undesirable to unify note issues subject to such different influences. A second and most important suggestion made by him was that the Bank of England should control exchange rates by holding "foreign securities" and "foreign credits": the Bank, he thought, could always

manage the situation if it took care not to expand circulation automatically as gold flowed in and kept foreign paper in its portfolio.

T. E. GREGORY

Important works: Gilbert's writings on banking and currency are collected in *Works*, 6 vols. (London 1865-66).

Consult: The biographical memoir in the *Works: Select Statutes, Documents and Reports Relating to British Banking, 1832-1928*, with an introduction by T. E. Gregory, 2 vols. (London 1929) vol. i, p. ix-lx, 70-117.

GILBERT, THOMAS (1720-98), English politician and poor law reformer. Gilbert was a member of Parliament from 1763 to 1795. By suggesting the employment of the famous engineer Brindley and by other means he helped to promote the development of canals; he was also the author of acts for reforming houses of correction and for helping friendly societies, but his importance lay in poor law reform. Gilbert put his finger on the main abuses of the system of his time: first, the small size of the unit of administration, the parish; second, the institution of the mixed workhouse, in which the sick and the idle, the sane and the mad, were herded together; third, the fact that the overseers were unpaid. In his bill of 1765, which failed in the Lords after passing the Commons, and in the measure of 1782 which bore his name Gilbert proposed that parishes should be allowed to join in unions and that these should be allowed to build workhouses for the care of the aged, the sick and the infirm. Sixty-seven such unions were established under the act, comprising 924 parishes. The able bodied poor excluded from the workhouses were to be given employment by paid officers created by the act. This well conceived reform demanded careful and intelligent administration. This was lacking in the years of distress which followed the Napoleonic wars, when the provision of outdoor relief became the basis of the economic life of the villages and the underpaid laborer received assistance from the poor rates according to the size of his family. This system of allowances was abolished by the drastic reform of 1834.

Consult: Webb, Sidney and Beatrice, "English Poor Law History," *English Local Government*, 9 vols. (London 1906-29) vols. vii-ix.

GILBRETH, FRANK BUNKER (1868-1924), American management engineer. After leaving high school Gilbreth entered the employ of a

contractor and builder, became foreman and then superintendent and in 1895 established himself in the same business. Stimulated by the management technique of Frederick W. Taylor, he experimentally applied its principles to bricklaying and increased output among his workers from 1000 to 2700 bricks a day. In 1912 he began practise as a consultant in management. His inventive imagination and mechanical aptitude were manifest in numerous devices and systems for the building arts and in the application of micromotion methods to the study of industrial operations. His outstanding contributions to the technique of scientific management, made jointly with his wife, Lillian Moller Gilbreth, were emphasis on motions in standardizing operations; utilization of the cinematograph and cyclegraph in recording them for subsequent delayed motion analysis and elimination of unnecessary motions; classification of motions into basic types, for which he coined the word "therbligs"; a new insistence on the danger of fatigue; the development of simultaneous motion cycle charts; and the devising of instruction process graphs intelligible to illiterate workmen. Devices such as these and expressions such as "the one best way" also helped to dramatize scientific management and made Gilbreth one of its most forceful popularizers.

GILMAN, DANIEL COIT (1831-1908), American educational administrator. Gilman, with Eliot of Harvard and White of Cornell, was the chief maker of the modern American university, which he conceived as properly devoted to advanced research, unpartisan and non-sectarian, and essentially postgraduate. After serving as librarian at Yale, as secretary and money raiser for the Sheffield Scientific School and as president of the newly organized University of California, he became first president of the Johns

Hopkins University in Baltimore. Here he introduced what was for America an innovation: the undergraduate school became but an appendage to the graduate and professional schools. Endowed universities have tended to follow this scheme, but state institutions have not. Gilman also organized the often copied Johns Hopkins Hospital, staffed by the faculty of the medical school which he developed at Johns Hopkins. By his insistence upon a college degree and scientific study as prerequisites for entrance and by strongly supporting research he raised the level of medical training.

Gilman was also a leader in general social uplift movements. He formed and for ten years was president of the Charity Organization Society of Baltimore, an early and successful example of systematic philanthropy. A plan drawn up by him became the basis of the program of the Russell Sage Foundation. He helped persuade Andrew Carnegie not to found a new university but to use his money in other directions, and served from 1901 to 1903 as first president of the Carnegie Institution.

Gilman had no interest in pedagogical theories, conceiving of a university as chiefly a research institute where eminent scholars shared their enthusiasms with younger men. Methodology did not interest him either in education or social work. He was concerned with immediate problems rather than with fundamental criticism of institutions.

BERNARD IDDIGS BELL

GINER DE LOS RÍOS, FRANCISCO (1839-1915), Spanish philosopher and educator. Giner studied law at the universities of Barcelona and Granada. From 1866 until his death he was professor of jurisprudence at the University of Madrid except for two brief periods during which he severed his connection with the university as a protest against religious and political tests for teachers.

Giner was a disciple of Sanz del Río, who introduced the philosophy of Krause into Spain, and he applied the latter's theories to the philosophy of law, adapting them, however, to contemporary intellectual tendencies. His chief works in this field are: *Principios de derecho natural* (Madrid ? 1873) and the unfinished *Resumen de filosofía del derecho* (Madrid 1898), both written in collaboration with his pupil Alfredo Calderón y Arana. In penology Giner developed and elab-

orated Röder's doctrines. His conception of punishment is typical of the Spanish school in that he regarded it as a tutelary process intended not only to protect society against criminal transgressions but also to protect the offender against himself and to effect his correction and social readaptation. Accordingly he favored the abolition of capital punishment. In sociology Giner's most interesting work is *Estudios y fragmentos sobre la teoría de la persona social* (Madrid 1899), which was based upon the social organism theory but was free from the exaggerations of the biological school of sociology.

Giner is primarily important, however, as an educator. He was a preeminent figure in the recent Spanish renaissance through his personal influence upon his pupils as well as through his general educational work and his writings. He was the moving spirit of the group which in 1876 founded the *Institución Libre de Enseñanza*, an unofficial institution which developed an educational system complete from the primary school to the university and thereby exerted a liberalizing influence upon the general educational policy of the Spanish government. Giner's pedagogical system completely rejected the idea of reward and punishment and respected individual initiative. Its most original feature was its emphasis upon artistic training, begun in childhood, as an aid to moral development. Giner's activity among the middle and upper classes may be compared to that of Pablo Iglesias among the proletariat. Both men were outstanding in the intellectual and political movement which led to the regeneration of contemporary Spain.

GINN, EDWIN (1838-1914), American publisher and peace advocate. Ginn became actively interested in the peace movement in 1901 and was impressed by its need for efficient methods of organization, more widespread educational work and more generous financial support. He advocated the limitation of armaments and the development of a permanent international armed force. His most important contribution

to the peace movement, however, lay in the fact that he was the first to endow and organize educational peace work on a large scale. He made possible a widespread distribution of important books on peace and a mass of concise pamphlet literature. He contributed to the support of the American School Peace League and the Cosmopolitan Club movement, financed peace work among women's clubs, furthered peace activities among his associates in chambers of commerce and supported Anna B. Eckstein in her work of collecting throughout Europe more than two million signatures to an arbitration petition which was presented to the Second Hague Conference. That educational work for peace might be put on a permanent basis Ginn founded and endowed the World Peace Foundation, which, occupying a position somewhere between propagandist and scientific organization, has made facts relating to the development of international peace machinery widely available.

Ginn was also interested in the promotion of better relations between capital and labor and furthered the movement for better housing conditions for the poor.

GINSBURG, ASHER (1856-1927), Jewish social philosopher. Ginsberg was born in Russia and was educated in an orthodox Jewish family. As a student he came under the influence of European rationalism and of English evolutionary philosophers, especially Herbert Spencer and J. S. Mill. His essays, written in an entirely new philosophical language under the pen name Ahad Ha-am ("one of the people"), are classics of modern Hebrew, which they helped create. Ahad Ha-am accepted the traditional Jewish idea that the Jews are a unique group whose life is entirely built upon ethico-religious foundations. Although he recognized the historical origin and evolution of these foundations, they nevertheless remained for him, as for those who regarded their origin as divine, absolute values. Whatever the source of Judaism (for him chiefly the doctrine embodied in the teaching of the prophets), it is the soul of the Jewish people and

must be the guiding principle of Jewish individual and group life. The weakening of Judaism, the disintegration of the Jewish people through the loss of its soul, were for Ahad Ha-am the true "Jewish question." In contrast to Herzl, the political Zionist, Ahad Ha-am, the founder of cultural Zionism, believed that the political and economic difficulties of the Jews in the Diaspora were incurable but that the Jewish people could be regenerated by creating in the old Jewish homeland a "spiritual center" on a sound economic basis whose Jewish thought and way of life could exercise a revivifying influence upon the Jewish soul in the Diaspora. As far back as 1891 he drew attention to the importance of the presence of the Arabs in Palestine, and even after the issuing of the Balfour Declaration realized that the existence of a large Arab population put anything like a Jewish state in Palestine out of the field of practical politics. A Jewish state or majority in Palestine were for him not only impracticable but unessential. His starting point had not been the poverty or the political and moral oppression of the Jewish masses but the heritage of centuries of Jewish life and striving for continuance and self-expression. Since Jewishness meant to Ahad Ha-am the ideas of absolute justice and impartiality, something always "anormal," a living protest of the spirit against the sword, a Jewish community in Palestine could in no way be similar to other national groups or states. To "normalize" Jewish life would mean a betrayal of the Jewish mission. Although Herzl's political Zionism was predominantly accepted within the Zionist movement, Ahad Ha-am deeply influenced Jewish thought of recent years and his apolitical, spiritual nationalism, which he ascribed for historical reasons only to the Jews, became the guiding principle in the development of a new theory of nationalism by his Jewish followers.

GIOBERTI, VINCENZO (1801-52), Italian philosopher and statesman. Shortly after his ordination as priest in 1825 Gioberti began to display the nationalistic zeal which was to dominate his life, and having fallen under the suspicion of the Piedmontese court he was exiled by Charles Albert in 1833. During the next fifteen years, which he passed in France and Belgium, he developed the principles of an idealistic philosophy known as ontologism. Continuing the battle begun by Galluppi and Rosmini against sensationalism Gioberti harmonized his philosophy with Catholicism and regarded God (*Ente*) not as the ideal and abstract but as the real and active creator of all visible phenomena (*esistente*). His philosophy, which exerted great influence on later Italian idealistic systems, became for Gioberti the basis of a nationalistic theory. History was the process by which the cycle begun in creation was completed: *l'esistente ritorno all'Ente*. Hence the Italian *Risorgimento* must be, first of all, a spiritual renaissance resting upon a reidentification with tradition. Since he believed Catholicism to be the only true terrestrial expression of the *Ente* and therefore the essence of civilization; since, moreover, Italy as the seat of Catholicism was culturally linked with the true idea, Gioberti thought himself justified in affirming the superiority of the Italians to all other people in works of genius. This was the theme of the famous excursus to Gioberti's most important work, *Del primato morale e civile degli italiani* (Brussels 1843, 2nd ed. 1845; new ed. by G. Balsamo-Crivelli, 3 vols., Turin 1919-20). The book won for him great renown in Italy and became one of the motive forces ushering in the nationalist movement of 1848, the more so because with its debatable doctrine of Italian hegemony it combined political proposals more firmly founded on immediate historical fact. In opposition to the revolutionary methods of Mazzinian democracy Gioberti set forth a plan of Italian unification to be effected through a series of pacts between the various Italian princes and to issue in a federation headed by the pope. The Italian people, he declared against Mazzini, was still too nebulous to be the basis of substantial hope; reality was represented only by the pope and to a lesser degree by the princes. Gioberti's

error lay in his belief that the force of such an international institution as the church could be identified with that of a single nation, and the facts demonstrated the rashness of his hopes. In 1848 when Pope Pius IX allied himself with the independence movements in the various Italian states, Gioberti seemed for a while to be an inspired prophet: he returned to Italy acclaimed by the nationalists and during a period of two months directed the government of Piedmont. But the unfortunate outcome of the campaign against Austria and the defection of the pope as well as of the princes from the Italian federation caused the rapid fading of Gioberti's prestige. In 1849 he went once more into exile. The disillusionment arising from his experiences provided, however, a salutary stimulus for the revision of his thought. In the major political work of his second exile, the *Del rinnovamento civile d'Italia* (2 vols., Paris and Turin 1851; new ed. by Fausto Nicolini, 3 vols., Laterza 1911-12), he abandoned the doctrine of federalism in favor of unity, advocated a democratic government instead of moderate constitutionalism and assigned the task of guiding Italian unification no longer to the pope but to the Piedmontese dynasty of Savoy. In this change of political viewpoint were reflected also the results of a profound philosophical crisis, during which Gioberti became disgusted with Catholic dogmatism and adopted a lay philosophy akin in tone to that of the German idealists.

GUIDO DE RUGGIERO

Consult: Anzillotti, Antonio G., *Gioberti* (Florence 1922), and *La funzione storica del giobertismo* (Florence 1923); Gentile, Giovanni, "Il realismo politico di Gioberti" in *Politica*, vol. ii (1919) 20-36, 161-78; Zbinden, Jean, *Die politischen Ideen des Vincenzo Gioberti* (Berne 1920); Solmi, Edmondo, *Mazzini e Gioberti* (Rome 1913); Cesarini-Sforza, W., "Socialismo Giobertiano" in *Rivista italiana di sociologia*, vol. xix (1915) 568-79; Mondolfo, Rodolfo, *La filosofia politica in Italia nel secolo XIX* (Padua 1924); Caramella, Santino, *La formazione della filosofia giobertiana* (Genoa 1927).

GIOIA, MELCHIORRE (1767-1829), Italian political theorist and economist. The early political writings of Gioia, who, as Mazzini noted, was the first champion of Italian unity, were directed against reactionary despotism, ecclesiastical domination and Jacobin intolerance. He was repeatedly imprisoned, once, in 1820, charged with being affiliated with the Carbonari. He contended in his best known work, *Del merito e delle ricompense* (2 vols., Milan 1818-19; 3rd ed. Capolago 1833), which was inspired by Beccaria's

Dei delitti e delle pene (1764), that the activities of individuals cannot lead to the common welfare unless they be free and unless their consciousness of responsibility coincide with the dictates of self-interest. His system of social ethics, built on the utilitarianism of Bentham, thus exalted personal responsibility and maintained economic utility to be the decisive criterion in moral and social questions.

In his economic works he dealt especially with such problems as the division of labor, costs of production and methods of increasing productivity and wealth. He advocated, as against Adam Smith, the desirability of state interference in industrial life for the organization of public services and as a stimulus to production and a protection for the workers. He foresaw the labor saving effects of machinery and held increased consumption to be a factor of civil and cultural progress. He perceived the errors of the mercantilists but vacillated between an endorsement of free trade and protectionism. He also made extensive statistical studies of collective life—demographic, economic, civic and social—which give him a distinguished position in the history of the social sciences.

GIOLITTI, GIOVANNI (1842-1928), Italian statesman. Giolitti was born at Mondovì, Piedmont, of a middle class family sprung from mountaineer stock. After he had learned the art of government during twenty years of administrative service, largely in the Board of Finance, he entered the Council of State in 1884 and the same year was elected to the Chamber of Deputies as a member of the Left. The financial inefficiency of the Depretis ministry and the economic distress resulting from the expiration of the commercial treaties with France presented a situation well fitted to accelerate the formulation of his two principal social purposes: fiscal reform directed toward more equitable distribution of taxes as well as toward greater economy, and progressive legislation. In 1889-90 he was secretary of the Treasury in Crispi's cabinet and in 1892 became premier. His ministry was troubled by the agitations of the Sicilian workers' organizations, or *fasci*, which he refused to dis-

solve, and by the Banca Romana scandals. To the latter he responded by abolishing the old bank and creating the Banca d'Italia subject to new legal regulations, but the report of the parliamentary inquiry commission forced him to resign in 1893. With his political influence greatly impaired but his personal integrity unimpeached he spent the next two years weathering the aftermath of the scandals, the *plico* affair and the "moral controversy" with Crispi. In 1897 he resumed political activity and regained his prestige through sustained attacks upon the reactionary government of Pelloux. He was appointed home secretary by Zanardelli in 1901 and two years later became premier for the second time. His three successive ministries, 1903-05, 1906-09 and 1911-14, were the period of the so-called *dittatura giolittiana*. His program, announced in his first ministry, for ending the "transformist" regime through the realignment of two great parties, the Conservative and Progressive, was never realized; and although he always observed strict constitutional procedure he ruled in fact through a succession of mixed, unorganized majorities. In a period of great economic expansion he progressively improved the status of the lower classes not only by multitudinous welfare and educational laws but by the non-interventionist and sympathetic attitude which he steadfastly manifested toward workers' organizations and strikes. By this policy he weakened the activity of the Socialists but they resisted his repeated invitations to join his government. The radicals were, however, included in his 1911 ministry, during the incumbency of which he passed a law of universal suffrage, raising the electorate from 3,500,000 to 8,000,000, and brought to Italian expansionist ambitions their first realization in the occupation of Tripoli and the Libyan war. When the World War came during the Salandra ministry, Giolitti stoutly defended Italian neutrality and from the May days of 1915, which his attitude provoked, until November, 1917, he remained in seclusion. At the general elections of 1919 he outlined a pacifistic and democratic program and once more made unsuccessful overtures to the Socialists, who were then dominated by Bolshevistic extremism. The following June he entered upon his fifth and last ministry (1920-21), the principal events of which were the reorganization of the budget and the conclusion of the Rapallo treaty with Yugoslavia. Fascism found in him encouragement, even after the "march to Rome," and it was not until the

autumn of 1924 that he passed over to the parliamentary opposition, at the head of which he remained until his death.

LUIGI SALVATORELLI

Ady (Oxford 1929) chs. vii-xii; *Giolitti*, ed. by Luigi Salvatorelli (Milan 1920), containing a selection of Giolitti's speeches, with introduction; Quirielle, Pierre de, in *Correspondant*, vol. cccxii (1928) 340-57; Salvatorelli, L., "Giolitti und seine auswärtige Politik" in *Europäische Gespräche*, vol. vii (1929) 117-37; Claar, M., "Giovanni Giolitti und die liberale Parlamentsdiktatur in Italien" in *Zeitschrift für Politik*, vol. xviii (1928-29) 231-39.

GIRARD, JEAN-BAPTISTE (1765-1850), Swiss educator. Girard, a Franciscan monk generally known as Father Grégoire, played a great part in the organization of compulsory primary schools and in the creation of teachers' seminaries in Switzerland. Under the Helvetic Republic he collaborated with P. A. Stapfer, minister of arts and sciences, and in 1799 arranged a "Projet d'éducation publique pour la république l'Helvétique" (printed in *Politisches Jahrbuch der schweizerischen Eidgenossenschaft*, vol. viii, 1894, p. 537-72), which was, however, never acted on. In 1804 he became director of the French primary schools of Fribourg and established a system of mutual education. Later he collaborated on the report of a government commission to investigate the Yverdon school (*Rapport sur l'institut de M. Pestalozzi à Yverdon*, Fribourg 1810). Although a disciple of Rousseau and Pestalozzi he looked to science and liberty to regenerate mankind. Girard placed great emphasis on the moral and religious side of education. He was considerably influenced by Kant, objected to Pestalozzi's emphasis on mathematics, which, he feared, would encourage materialistic thinking, and contended that intelligence must be cultivated as the only sound basis for Christian faith. His technique of teaching was concrete and intuitive and based on interest, emulation and a discipline free from corporal punishment and other constraints. The children instructed each other under the teacher's supervision; they were encouraged to debate all questions with a view to developing their reasoning powers; and they operated a form of self-government.

Although Girard was neither profound nor wholly original, his pedagogical system attained wide renown, and his defense of the teaching of grammar as an aid to intellectual development

had considerable influence, especially on French pedagogy. He worked for the separation of church and state, the establishment of non-denominational schools and the development of religious toleration in general. He founded asylums and orphanages, contributed to the abolition of torture in Fribourg and helped improve conditions in children's reformatories. After 1823, when as a result of the opposition of the Jesuits and reactionaries he was dismissed and his work destroyed, Girard devoted himself to writing on pedagogy.

N. ROUBAINE

Important works: *Mémoire sur l'enseignement religieux de l'école française de Fribourg* (Fribourg 1818); *De la nécessité de cultiver l'intelligence des enfants pour en faire des chrétiens* (Toulouse 1822); *Dialogue sur la formation d'instituteurs pour les écoles alpêtres* (Lucerne 1826); *Der moralische Wert des wechselseitigen Unterrichts* (Lucerne 1826); *Cours éducatif de langue maternelle à l'usage des écoles et des familles*, 6 vols. (Paris 1840-48); *De l'enseignement régulier de la langue maternelle dans les écoles et les familles* (Paris 1844, 9th ed. 1894), tr. and adapted by the Third Earl Fortescue as *The Mother-Tongue* (London 1847).

Consult: Daguet, Alexandre, *Le Père Girard et son temps*, 2 vols. (Paris 1896); Compayré, G., *Le Père Girard* (Paris 1906).

GIRARD, PAUL FRÉDÉRIC (1852-1926), French jurist. Girard taught at the University of Paris for over thirty years and put new life into the study of Roman law in France by aligning himself with the German historical movement. He, for instance, translated Mommsen's celebrated work on the public law of the Romans (8 vols., Paris 1887-95). He made, however, many important contributions of his own to the history of Roman law. He interested himself somewhat in the Romanists of the Renaissance, but he was most strongly attracted toward the ancient Roman law and he had a particular penchant for problems of a procedural cast. Two of his earliest studies, one of them on the guaranty of eviction and the other on the noxal actions, already show his success with the historical method in the reconstruction of Roman law. The first volume of his projected *L'organisation judiciaire des romains* (Paris 1901)—the only one published—traced the history of the first six centuries of Roman judicial organization. Three of Girard's most important studies belong in this field: the first on the date of the *lex aebutia*, by which the older procedure of the *legis actiones* was made optional; the second on the date of the perpetual edict of Julian, which fixed in its final form the

praetorian law which had developed Roman jurisprudence through its remedial aspects; and the third on the *leges juliae judiciorum publicorum et privatorum*, one of which abolished the *legis actiones* altogether. Girard was also instrumental in elucidating some aspects of the edict before its final revision by Julian, when he discovered in the Bibliothèque Nationale a second manuscript of a list of abbreviations, the *notae juris* of the first century grammarian Valerius Probus. Girard indeed had a great interest in texts, and in a study on the Twelve Tables he defended their authenticity. But apart from all his monographs, most of which are collected in his *Mélanges de droit romain* (2 vols., Paris 1912-23), Girard's world wide reputation rests upon his *Textes de droit romain* (Paris 1890, 5th ed. 1923) and his *Manuel élémentaire de droit romain* (Paris 1896, 8th ed. 1929), which has been translated into German and Italian and in part into English (Toronto 1906). This great manual reveals Girard's gifts of systematization. In harmony with the newer studies it substituted for the traditional solution others more in consonance with the social evolution of the Roman world.

PAUL COLLINET

GIRARDIN, ÉMILE DE (1806-81), French journalist. Before the time of Girardin the big Parisian dailies supported themselves by charging an annual subscription price of eighty francs per annum. No single copies were sold and only a limited amount of advertising matter was carried. Girardin founded the *Presse* in 1836, cut the subscription to forty francs a year and gave increased space to advertising in order to finance his paper. A greater variety of reading matter, particularly feuilletons, was printed. Like James Gordon Bennett's *Herald* in the United States, the *Presse* had a rapid success, and Girardin strengthened this by allying himself with the Société Générale des Annonces, which had a monopoly of the press of Paris. The other dailies taken over by Girardin, *Liberté* and afterwards *France*, also enjoyed great popularity.

In politics Girardin was independent and mercurial. Long well liked by Louis Philippe, he finally became a violent opponent of Guizot. He supported the Republic in February, 1848, but became a fierce enemy of Cavaignac. He was first an adversary, later an adherent, of Napoleon III. His last great campaign against

Brogie's cabinet after the coup d'état of May 16, 1877, led the Republicans to elect him deputy from Paris. In 1870 he preached war, although ordinarily and especially in his later years he declared himself for peace and complete disarmament. He habitually presented rather adventurous and admittedly unfeasible ideas and utopias, which he deemed necessary to arouse public discussion. Although he enjoyed great popular interest, his reputation as a cynic pre-occupied with money matters somewhat impaired the extent of his influence. Adept at sensing public opinion, he always followed it and always accepted a *fait accompli*. On only one point did he never change: of every administration he demanded freedom of the press.

GEORGES WEILL

Consult: Lebey, André, "Idées politiques d'Émile de Girardin (1840)" in *Revue de Paris*, année XVIII, vol. ii (1911) 564-84; Datz, P., *Histoire de la publicité* (Paris 1894); Avenel, Henri, *Histoire de la presse française depuis 1789* (Paris 1900) p. 362-68; Renard, G. F., *Les travailleurs du livre et du journal*, 3 vols. (Paris 1925-26) vol. ii, p. 229-39.

GIRDLESTONE, EDWARD (1805-84), English clergyman, agrarian and social reformer. Girdlestone was educated at Oxford and seemed destined to pursue a purely clerical career, but his interest in labor problems was soon stimulated by experiences in his Lancashire incumbency of Deane, which brought home to him prevailing factory conditions. He wrote various periodical articles on labor conditions in the mines and factories and on similar subjects. Promoted to a canonry at Bristol, he turned his energies toward rural issues, winning his title of the "agricultural labourer's friend." To the 1863 meeting of the British Association for the Advancement of Science held at Norwich he described conditions in rural parishes and urged the formation of an agricultural laborers' union. Thereafter he was associated with Joseph Arch, Jesse Collings and others in their campaign of agrarian reform. His connection with the subsequently formed Agricultural Labourers' Union was weakened by its bias against the established church, but his zeal for the wider aspects of the cause never flagged. He advocated a constructive program, including the provision of better education and housing, revision of the poor law and access to the land. Holding that the clergy had "done less for this end than any other class despite their spiritual interest" he himself, when ultimately vicar of Halberton, Devonshire, was instrumental in removing several hundred families

from that impoverished county to the better paid areas of England. Canon Girdlestone combined a high organizing ability with the attributes of a conscientious cleric and devoted his life to the betterment of the working classes at a period when it was unorthodox.

GIRL SCOUTS. *See* BOYS' AND GIRLS' CLUBS

GIRY, ARTHUR (1848-99), French historian. Giry was professor at the École des Chartes and at the same time a member of the department of the historical sciences at the École des Hautes Études, where he trained numerous scholars and where around 1875 he began to concentrate his research on the history of the municipal institutions of mediaeval France. This field, the interest of which had been revealed some twenty-five years earlier by the publication of documents supervised by Augustin Thierry, was still virtually unexplored. Accordingly Giry and his pupils set themselves the task of superseding Thierry's vague generalizations by a series of scholarly monographs devoted to a careful analysis of the clauses of the charters of urban franchises, to a study of the spread of these charters and their application in various French regions and to an analysis of the character of the political and administrative government of the urban or rural "communes" in the twelfth, thirteenth and fourteenth centuries. The first of these monographs to appear were Giry's *Histoire de la ville de Saint Omer et de ses institutions jusqu'au XIV^e siècle* (Paris 1877) and Flammermont's *Histoire des institutions municipales de Senlis* (Paris 1881). These were followed by Giry's *Les établissements de Rouen* (2 vols., Paris 1883-85), a study of the municipal organization of Rouen and the cities of Normandy, Poitou, Saintonge and Gascony, all of which received from the Plantagenet kings institutions similar to those of Rouen. A collection of *Documents sur les relations de la royauté avec les villes de France de 1180 à 1314* (Paris 1885), an *Étude sur les origines de la commune de Saint-Quentin* (Saint-Quentin 1887) and a series of volumes by his pupils (*Les coutumes de Lorris* by M. Prou, Paris 1884; *Histoire de la ville de Noyon* by A. Lefranc, Paris 1887; *Histoire de la constitution de la ville de Dinant au moyen âge* by H. Pirenne, Ghent 1889; *Histoire de Beauvais* by L. H. Labande, Paris 1892; *Essai sur l'histoire d'Agen* by A. Ducom,

Agen 1892) are further testimonials to the industry of his seminar. The broader conclusions drawn from these researches are confined unfortunately to two brief chapters written in collaboration with A. Réville for Lavissee and Rambaud's *Histoire générale* (vol. ii, Paris 1893, chs. viii-ix; ch. viii tr. by F. G. Bates and P. E. Titworth, New York 1907). Giry prepared also a history of the reign of Charles the Bald and a collection of his acts as well as a study of Carolingian diplomatics, the *Étude critique de quelques documents angevins de l'époque carolingienne* (Paris 1900). The researches of his pupils, notably F. Lot, P. Lauer, R. Poupardin and E. Favre, resulted in numerous monographs on the period following Charles the Bald.

LOUIS HALPHEN

Consult: Lot, Ferdinand, "Arthur Giry" in *École Pratique des Hautes Études, Section des Sciences Historiques et Philologiques, Annuaire* (1900) 20-47; Omont, Henri, "Notice sur la vie et les travaux de M. Arthur Giry" in *Bibliothèque de l'École des Chartes*, vol. lxii (1901) 5-14.

GIUSTI, GIUSEPPE (1809-50), Italian satirist. Giusti was one of the principal literary figures of the moral revival which was the prime and indispensable condition of the political regeneration of the Italian nation. As early as 1836 he had become the poet of the patriots of union through his *Lo stivale*, which had at once become popular. In this poem Italy, represented by a boot, recounts its dolorous story and then beseeches some man of courage and vision to unite it into a single state and free it from the stranger, making it become

. . . con prudenza e con amore
Tutto d'un pezzo e tutto d'un colore.

In the *Incoronazione* (1838) the poet attacks the sovereigns of the petty Italian states, who hastened to do homage to the new emperor of Austria when he came to Milan for his coronation; and the *Brindisi di Girella* (1840) is a bitter satire against politicians who bow down before the idol of the day, accepting supinely any government in power. The *Gingillino* (1845) is a violent satire against those of the youth who lent themselves to the sorry business of courting and even acting as spies for the petty tyrants of the time to smooth their own way to promotion in the bureaucracy. In the *Guerra* (1846) the poet satirizes the pacifists who cried for peace when peace was impossible, pointing out that without war Italy could not be freed. In the same year, hearing a sacred hymn set to Italian music sung in chorus by Bohemian and Croatian soldiers

in the old temple dedicated to St. Ambrose, he was moved to compose one of his finest poems, the *Sant'Ambrogio*, in a mood of pity for the oldiers who as the unwitting instruments of a tyrannical government were holding Italy in slavery. In 1848 Giusti was elected to the Tuscan parliament and worked with the moderate party rather than with the ultrademocratic. In all his poems as well as in his prose writings Giusti lashed the servility and selfishness of the upper and middle classes and the charlatany of the demagogues who fawned upon the people for their own selfish ends.

GLADSTONE, WILLIAM EWART (1809-98), British statesman. At Eton and Oxford Gladstone gained high academic distinction as well as fame in debate. Except for a short interval in 1846 he was a member of the House of Commons from 1833 until his retirement in 1894. As vice president and president of the Board of Trade from 1841 to 1845 he served as Sir Robert Peel's chief lieutenant in a sweeping reform of the tariff which paved the way for the repeal of the corn laws in 1846. From Peel he learned the principle and practise of public economy which he always associated with private thrift. As chancellor of the Exchequer under Aberdeen and Palmerston he prepared the budgets of 1853 and 1860, in which like Peel he used the income tax to remove or reduce many protective customs duties. The latter budget was bound up with the Anglo-French commercial treaty negotiated by Cobden, and the work of free trade was thereby practically completed. In 1867 he succeeded Earl Russell as leader of the Liberal party and as prime minister from 1868 to 1874 directed what was perhaps the greatest reform administration of the century. He disestablished the Irish church, abolished the system of purchasing commissions in the army, removed religious tests from the universities, introduced the ballot at elections and set a great example in peace methods by submitting the *Alabama* claims to arbitration. The general elections of 1880 gave Gladstone a handsome majority; but his second administration, from 1880 to 1885, when he resigned after extending the franchise to agricultural laborers, was marred

by troubles in the Transvaal, in Egypt and in Ireland. His generous scheme of home rule for Ireland was frustrated during his third administration by the defection of Liberal Unionists and by the Parnell scandal. During his fourth and final administration the second Home Rule Bill after passing through the House of Commons was thrown out by the House of Lords; and in March, 1894, Gladstone retired.

Gladstone's greatest achievements as a statesman were perhaps in public finance, every detail of which he mastered with unrivaled skill and indefatigable industry. In all the arts of public economy he was a disciple of Peel and an ally of Cobden. He waged incessant war on public waste and did more than any other statesman of the nineteenth century to arrest the growth of armaments and to provide substitutes for war between nations. His outlook on social life and on the economic problems of capital and labor was that of a sincere Christian and a convinced individualist, who endeavored to impress upon all classes the duties of self-help and cooperation as well as the dangers of relying too much upon legislation and parliamentary interference with industry.

FRANCIS W. HIRST

Consult: Morley, John, *Life of William Ewart Gladstone*, 3 vols. (London 1903); Craemer, Rudolf, *Gladstone als christlicher Staatsmann* (Stuttgart 1930), with bibliography p. 500-06; Knaplund, Paul, *Gladstone and Britain's Imperial Policy* (London 1927); Eversley, George John, *Gladstone and Ireland* (London 1912); Burdett, O. H., *W. E. Gladstone* (London 1927); Buxton, Sydney, "Mr. Gladstone as Chancellor of the Exchequer" in *Fortnightly Review*, n. s., vol. lxi (1901) 590-611, 785-807; Malarce, A. de, "Trois grands 'acts' de Gladstone" in *Journal des économistes*, 5th ser., vol. xxxv (1898) 62-69.

GLANVILL, RANULF DE (also written as Glanvil, Ranulph de, and as Glanville) (d. 1190), had a varied career as sheriff, judge, warrior, diplomat and statesman under Henry II. The law book now known by his name (*Tractatus de legibus et consuetudinibus regni Anglie*) was finished after 1187 and before 1190. It is unlikely that he wrote it, but he may have influenced his lawyer nephew and secretary Hubert Walter (afterwards archbishop of Canterbury), to whom Maitland conjecturally ascribed it. Several procedural treatises were then appearing on the continent, and in England William Longchamp may have already written his little work on civil and canonical procedure advocating a formulary system of writs; if this is so, then Glanvill's emphasis upon the writ is all the more

interesting. It is likewise significant that the *Dialogue de scaccario* is of the same date, the coincidence showing that separate treatises on law and administration were already possible. Glanvill implies a collection of writs already arranged along the lines of the *Registrum brevivum*. The question of Roman influences is less difficult than with Bracton, for Glanvill does not attempt to make practical use of his Roman learning. Glanvill's influence in England was great, for his work served to standardize the rules which the king's court was evolving. It was, moreover, the first to be written exclusively about the new royal common law (as distinct from ancient regional customs). Realizing that the common law was growing around the procedural rules of the king's court and that local variants were doomed to disappear Glanvill adopted the form of a commentary upon royal writs and thereby set the pattern for legal writing for several centuries to come. Glanvill's book was widely read and was treated with respect by Bracton, whose larger book naturally superseded it. An enlarged and modified version of Glanvill was current in Scotland under the title *Regiam majestatem* and enjoyed high authority.

THEODORE F. T. PLUCKNETT

Works: The best edition so far is that by J. E. Wilmot and J. Rayner (London 1780); it was also printed in France by David Houard (*Traité sur les coutumes anglo-normandes* . . . , 4 vols., Paris 1776, vol. i, p. 373-581), and in Germany by George Phillips (*Englische Reichs- und Rechtsgeschichte* . . . , 2 vols., Berlin 1827-28, vol. ii, p. 335-473). A new edition by G. E. Woodbine is being prepared by the Yale University Press. John Beames' English translation (London 1812) was revised by J. H. Beale (Washington 1900). *Regiam majestatem* and Glanvill are printed side by side in *Acts of the Parliaments of Scotland*, vol. i (Edinburgh 1814).

Consult: Holdsworth, W. S., *History of English Law*, 9 vols. (3rd ed. London 1922-26) vol. ii, p. 176, 188-92, where further references are also given.

GLASER, JULIUS (1831-85), Austrian jurist. Glaser became professor of criminal law at the University of Vienna at the age of twenty-nine but soon gave up his teaching for legislative labors in the Austrian Ministry of Justice, the direction of which he took over in 1871. Forced to resign in 1879 as the result of a cabinet crisis, he became procurator general to the Court of Cassation in Vienna, a post which he held until his sudden death.

Glaser's chief importance is in the field of criminal procedure. The Austrian code of crimi-

nal procedure of 1873, which replaced the reactionary law of 1853 and is still in force, was his creation. It represented the realization of modern principles of criminal procedure in Austria and bears unmistakable marks of the influence of English-Scottish criminal procedure, for the reception of which Glaser had argued in a series of publications. After a hard struggle he succeeded in securing the retention of trial by jury. Like many of his contemporaries Glaser saw in the participation of laymen in the deciding of the question of guilt an indispensable guaranty against abuses arising from the prevailing judicial freedom in the evaluation of proof.

Glaser's most important literary productions were his unfinished *Handbuch des Strafprozesses* and the *Beiträge zur Lehre vom Beweis*. He conceived the central point of every process to lie in the question of proof, which for that reason must form the core of any science of procedure. In his essays on evidence, which even today are fundamental, he was particularly concerned with showing that a law of evidence was still necessary despite the acceptance of the principle of the free evaluation of proof. In conjunction with his friend and colleague Josef Unger, Glaser succeeded in reestablishing the contact of Austrian law with German national jurisprudence and in inaugurating a new and brilliant period in Austrian legal science.

ERICH SCHWINGE

Important works: *Abhandlungen aus dem österreichischen Strafrecht* (Vienna 1858); *Schwurgerichtliche Erörterungen* (Vienna 1875); *Handbuch des Strafprozesses*, Systematisches Handbuch der deutschen Rechtswissenschaft, ed. by Karl Binding, sect. ix, pt. iv, vols. i-iii, 3 vols. (Leipsic 1883-1907); *Beiträge zur Lehre vom Beweis im Strafprozess* (Leipsic 1883); *Gesammelte kleinere Schriften über Strafrecht, Civil- und Strafprozess*, 2 vols. (Vienna 1868, 2nd ed. 1883).

Consult: Lammasch, Heinrich, in *Zeitschrift für das Privat- und öffentliche Recht der Gegenwart*, vol. xiv (1887) 675-703; Benedikt, Edmund, in *Allgemeine deutsche Biographie*, vol. xlix (Leipsic 1904) p. 372-80; Unger, Josef, *Julius Glaser, ein Nachruf* (Vienna 1885).

GLASIER, JOHN BRUCE (1859-1920), British socialist. Glasier was born in Glasgow and was a designer of art metal work by vocation. Beginning with a stern Calvinism he moved with the rising wave of social revolt which at the beginning of the eighties carried many British intellectuals from Darwin and Huxley through Ruskin, Mill and Henry George to socialism. In 1879 he began to lecture on social problems. He took an active part in the Irish and Highland

Land League and was one of the organizers of the Henry George campaign in 1883. In 1884 he became a member of the Social Democratic Federation and after its split joined the Socialist League founded by his friend William Morris. With the formation of the Independent Labour party (I.L.P.) in 1893 Glasier, who despite his Darwinism was essentially idealist, ethical and inclined toward mysticism and conceived socialism as a humanist religion, found his most congenial sphere of activity. The I. L. P. conceived its socialism as a living faith, caring nothing for materialist determinism nor for revolutionary economics. In homely speech, in hymns and songs, some of which Glasier composed, it appealed to the moral and primitive Christian sentiments of the working people, asking them at the same time to act logically and apply trade union principles to politics, i.e. to form a party of their own to secure social justice for all. Carrying this message Glasier was second only to Keir Hardie in preparing the way for the formation of the Labour party in 1900. He held the highest offices of the I.L.P. and edited its weekly, the *Labour Leader*, from 1905 to 1909 and its monthly, the *Socialist Review*, from 1913 to 1917.

GLASS AND POTTERY INDUSTRIES.

Despite isolated survivals of handicraft production glass and pottery manufacture at present is definitely a mechanical industry. Before the end of the eighteenth century output was artistic in quality and limited in quantity; it expressed cultural more than utilitarian requirements. Potters were among the most highly skilled and best paid artisans, who jealously guarded and restricted membership in their guilds; in Venice a glassworker became a nobleman by virtue of his trade. (For early history see POTTERY.) The situation is now completely different: at present quantity production rules, and potters and glassworkers are on the whole on the same level both in status and earnings as the workers in other mechanized industries. On the other hand, the use of glass and pottery products (particularly glass) has been extended far beyond the small class which almost monopolized their output in the past.

The modern era in the production of glass and pottery began at the end of the eighteenth century, when the handicrafts gave way to the factory system. Mechanical methods were introduced to do work formerly done by hand, and a larger division of labor developed. The change in pottery production was signalized by the appearance of English white ware, which created a revolution in the industry. By the new method, which was more mechanical and economical than applying a coating of white or of tin enamel, the English produced a ware which was white throughout; it was superior in durability and its finish bore comparison with expensive porcelain. In addition, printed patterns were developed which were transferred instead of painted on the ware. These changes and an abundance of coal and coarse clays gave England the lead in developing a modern pottery industry.

In pottery as in other products England intensively developed its exports; the bulk of white ware was produced for sale abroad. These large exports led to the displacement of more artistic and expensive wares in foreign markets and the gradual ruin of the old pottery handicrafts. But other countries, particularly France, Germany and the United States, adopted the English methods and by 1840 England's pottery supremacy was over. Handicraft methods persisted in the making of more artistic wares; but pottery as a whole went over to quantity production under pressure of increasing demand and larger markets.

Changes developed more slowly in the production of glass, but when they came they went far beyond the technological changes in the pottery industry. Early in the nineteenth century American manufacturers introduced molding machines for making pressed glass, which revolutionized the process and considerably cheapened the prices of the product. But the really important changes were initiated by two European inventions—Siemens' regenerative furnace in 1861 and the continuous melting tank in 1872. In the regenerative furnace, which is now in use in all large glass plants, the heat produced is supplied by the combustion of air and gas. Formerly direct fire furnaces used wood or coal as fuel. Wood, particularly after all its moisture had been extracted, was a very effective fuel for the production of small quantities of good glass but very expensive. Coal was considerably cheaper, but the glass produced was darker and of an inferior quality. Not only is the regenerative furnace more economical, saving nearly 50 percent

in fuel, but its heat is more intense and uniform, extremely desirable for the proper melting of glass, especially in large quantities. The continuous melting tank, invented in 1872, took the place of the open or closed pots. Use of the continuous tank has become universal, except in the production of lamp chimneys and the better kind of pressed and blown glassware and colored glass. The principal advantage of the continuous tank lies in the opportunity for uninterrupted working of the glass; the batch is supplied at regular intervals to the melting end of the tank, while the molten glass is continuously withdrawn from the working opening. The regenerative furnace combined with the continuous tank made the glass industry ripe for the introduction of machinery, and it was not long afterward that the successful operation of the first semi-automatic machine for the production of wide mouthed jars was reported.

Although it introduced machinery in the making of pressed glass the American glass and pottery industry lagged behind Europe in both technological advance and output. In the colonial period there were a few glass and many pottery works producing household and kitchen ware; the white ware industry of New Jersey exported comparatively large quantities to the West Indies. Glassworks were established in Pennsylvania and New Jersey. After the revolution both industries developed considerably; some capital and many skilled glass and pottery workers were imported from Europe. One glass company in Massachusetts in 1815 had a capital of \$400,000 and employed 450 workmen producing cut, engraved and gilded glass. There were many small plants scattered over the country serving local markets, as a result of the widespread distribution of raw materials and the inadequacy of transportation. The glass and pottery industries did not develop rapidly until after the Civil War, when they were stimulated by the rapidity of general industrial expansion.

By 1870 power driven machinery was being used in the majority of American potteries, most of which specialized in the production of white ware. The great increase in the output of pottery, however, came from the production of sanitary ware, bound up with progress of sanitation and improvements in the construction of dwellings, factories and offices. By 1890 the output of sanitary porcelain was a substantial part of pottery production and thereafter increased rapidly. Simultaneously a few art potteries were established; they made an important contribu-

tion to artistic pottery by developing an original type of underglaze decorated faience.

In the glass industry the Siemens furnace was not adopted in the United States until 1871 and the continuous melting tank not until 1888, mainly because of the abundance of fuel and the large number of small plants. In 1873 the first plant was established for the production of polished plate glass, an important American contribution to the glass industry; and the output increased rapidly to supply the great demand by stores for show window glass. There was also considerable expansion in the output of window glass, large quantities of which had formerly been imported from Europe. At this time also electric light bulbs were first manufactured. The value of glass products increased from \$18,500,000 in 1870 to over \$40,000,000 in 1890.

In spite of the adoption of modern technical methods and the increase in output the American glass and pottery industries in 1900 were still behind Europe, with Germany and England in the lead. But American progress thereafter was rapid. By 1914 the value of pottery products was \$36,900,000; the output of glass products increased from \$41,000,000 in 1899 to \$123,100,000 in 1914. The production of commercial glass and pottery was concentrated in five nations: Germany led in scientific ware; England in artistic glassware and France in artistic pottery; the United States and Germany in sanitary porcelain and electric light bulbs; and the United States, Germany and Belgium in plate glass. Germany in particular made important contributions to the development of optical glass and of porcelain products for the use of the chemical and electrical industries.

The growth in the output of glass and pottery in the nineteenth century was bound up with the development of clay manufactures and with the general expansion of markets and industry. Demand was stimulated by rising standards of living, supplemented in Europe by intensive development of export markets. A whole series of new industries created new needs for glass and pottery, particularly the electrical industry with its demand for electric light bulbs and porcelain fixtures. The growth of cities stimulated the demand for window glass and sanitary porcelain. In the case of glass, however, the most important single factor was the introduction of new technical methods, particularly in the United States, which increased productivity to an extent equaled in few other industries.

Once given an impetus through the successful

application of the Siemens furnace and the continuous tank the glass industry rushed through all the stages of development from an almost 100 percent hand to a completely mechanized state, in the amazingly brief period of less than a quarter of a century. In 1899 the census reported only a few experimental attempts to blow bottles by the machine process. Twenty-five years later the glass industry had not only completely left behind the hand process of making glassware, but had also replaced with a more modern and automatic type of machine several types of machines which had taken the place of the skilled glassworkers. The semi-automatic machine first replaced the blower with a machine operator but still retained the gatherer and the presser. The Owens automatic machine and later also the "feed and flow" devices displaced all the skilled glassworkers, formerly used in the hand unit known as the "shop" or the "chair."

The development of machinery has not proceeded uniformly in all branches of the glass industry. Bottles and jars were the first to be affected by the machine process, and in this branch of the industry the development of automatic machinery went further than in any other glass product. Prior to the introduction of the machine process a hand shop consisting of three skilled workers—two blowers and one finisher—and four helpers could produce under normal conditions 30 gross of four-ounce prescription ovals during the regular working shift of eight hours. This amounts to 3.75 gross per shop hour, or .536 gross per man per hour. In 1925 the Owens automatic ten arm double triplex machine (sixty bottles per revolution) with an automatic conveyor attended by two machine operators and one machine foreman for each machine and one chief foreman for six machines averaged 69.75 gross of the same type of bottle per machine per hour. This amounts to 22.03 gross per man per hour, or more than 4100 times as much as with the hand process. The increase in productivity per man per hour shown in other articles ranges from 642 percent to 4009.8 percent in bottles and jars, from 391 to 1128.1 percent in pressed ware and from 42.3 to 3042.6 percent in blown ware. In window glass the increase in productivity is 128.4 percent in glass of double strength and 161.4 percent for single strength; in plate glass the increase in productivity is 45 percent for rough plate and 60.5 percent for polished glass.

Such a revolutionary change in productivity and in labor cost of producing glassware caused

by the introduction of machinery in the industry tremendously affected its economic and social structure. In 1899 the entire glass industry comprised 355 establishments employing 52,818 wage earners, or an average of 149 per establishment; in 1929 there were only 267 establishments employing 71,416 wage earners, or an average of 267 per establishment. But the figures for the industry as a whole do not tell the story of what happened in the separate branches, as the effects of the introduction of machinery have not been the same in the four principal divisions. In bottles and jars the general adoption of automatic machinery resulted not only in a diminution of the number of plants and wage earners in the industry but also in a decrease of the average number of wage earners per establishment. Fewer workers are seen in a large up to date machine bottle plant than in a small hand plant. In the pressed and blown ware the automatic machine has so far invaded only a small section of the industry, and the growth in this branch has therefore resulted in an increase in the number of plants and wage earners as well as in the average number of workers per establishment. In the window glass branch the predominance of the cylinder machine process cut the number of establishments by more than half, somewhat diminished the total number of wage earners and increased the average number of workers per plant nearly one and one third times. In plate glass, which until very recently witnessed no revolutionary changes, the growth of the industry more than tripled the number of wage earners used and nearly tripled the average number of workers per establishment.

The total number of workers employed and the average number per establishment cannot, however, be used as an indication of the change in the size of the establishment. A better means of measuring the change may be found in the quantity output per establishment, which in 1925 was 4.1 times as much as in 1899 in the case of bottles and jars; 3.7 times in the case of pressed and blown glass; 6.2 times in window glass; and 5.9 times in plate glass.

Another important result of the introduction of machinery is the disappearance of the smaller type of plant and the concentration of the industry in the larger establishments. In 1904 out of a total of 399 establishments 164, or 41.1 percent of the total, were of the type with a yearly output of less than \$100,000; and only five establishments, or 1.3 percent of the total, had a yearly output of more than \$1,000,000. In 1925 out of

a total of 310 establishments only 49 plants produced an output of less than \$100,000; and 83 plants, or 26.8 percent of the total, had a yearly output of more than \$1,000,000. Even more striking than the number of establishments in these two groups is their total value of output. In 1904 the 164 plants in the lower group reported a combined output of \$8,341,000, or 10.5 percent of the total value of the output for the entire industry. In 1925 the 49 establishments in the lower group reported an output of \$2,652,000, or less than 1 percent of the total value of the output. In 1904 the five establishments in the million dollar group produced 11.3 percent of the total output, while in 1925 the 83 establishments in the million dollar group produced 72.5 percent of the total value of the output of the entire industry.

Prior to the introduction of machinery the glass industry was predominantly a small unit industry. The amount of capital needed for a plant was comparatively negligible and the principal items for expenditure were fuel and skilled labor. A cheaper rate on coal or natural gas was sufficient inducement for the removal of a glass plant from one locality to another and from state to state. The history of the discovery of natural gas in Pennsylvania, Indiana, West Virginia and Oklahoma also tells the story of the migration of the glass industry to and from these states. With the advent of machinery the situation changed completely. Fuel is still a very large item in the cost of production of glass and is still considered the principal factor determining the site of a new glass establishment. But once the plant is built, the capital outlay on the building, the furnaces and the machines prevents the moving of the establishment irrespective of the cost of fuel. With the increase in the size of the plant and in the use of machinery the advantages of large scale production were brought into play, with the result that in the short span of twenty-five years the glass industry has been converted from a small and loosely connected industry into a large and well integrated one.

The glass industry is on the whole dominated by a few large corporations in spite of the many small shops. The Pittsburgh Plate Glass Company, manufacturing all kinds of window glass as well as paints, varnishes and safety glass, had assets in 1930 of \$99,605,000. The Owen-Illinois Glass Company, organized in 1903 as the Owens Bottle Machine Company, had assets of \$46,311,000; it is the largest manufacturer of bottles in the world as well as of bottling machines, the

patents of which it controls; it has practically a monopoly position and has paid unusually high dividends.

Machinery has not played so important a part in pottery as in the glass industry, but its influence is growing. Power driven machinery is in general use, and specialization is increasing. A considerable amount of up to date equipment and of labor saving devices are now used in preparing the slip and in firing the ware, and large quantities of sanitary porcelain are made by the casting process. This process secures the formation of the clay by pouring it into molds and removing it when the articles have dried. Nevertheless, pottery is still an industry in which manual dexterity is important; even in the casting of sanitary ware, which comes closest to an automatic process of production, there is still need for some skilled workers to handle the product. In the shop proper the potter's wheel, the jigger, the jolly and the potter's lathe constitute the sum total of machinery used in the actual making of pottery. The slip makers, jiggermen, pressers, kiln men, dippers, decorators and others, all highly skilled artisans, still occupy the most vital positions in the pottery industry. This accounts for the fact that wages of the pottery workers constitute the largest item of expenditure in the manufacturing of earthenware and china. In 1899 the census reported 1000 establishments producing pottery, terracotta and fire clay products; the 43,714 wage earners employed received in wages \$17,692,000, which constitutes 54.7 percent of the total value of \$32,348,000 added by manufacturing. In 1929 the preliminary census report gives 307 establishments producing pottery and sanitary ware only; the 34,958 wage earners employed received in wages \$43,365,000, which constitutes 53.2 percent of the total value of \$81,620,000 added by manufacturing, compared with an average of 36 percent for manufacturing as a whole. Thus more than 50 percent of the total value added by manufacture in the pottery industry is paid out in wages.

In spite of differences in the extent of mechanization the average yearly earnings of glass and pottery workers in 1929 were almost the same—\$1259 and \$1240 respectively: in both cases below the average of \$1300 for manufacturing industries as a whole. While skill is still required of pottery workers, it appears that manual dexterity among the majority is of the unskilled kind.

A comparison of rates of wages in the glass

industry between 1899 and 1929 is of no significance, because the nature of the work done and the kinds of labor used in the two years were entirely different. Thirty years ago the majority of workers employed in the glass industry consisted of highly skilled blowers, pressers, finishers and the like. By now only a small percentage of skilled labor has been retained, and the new class of glassworkers requires little if any preliminary training in handling the machines. In 1899 all skilled workers were paid on a piece-work basis, while now the overwhelming majority of the workers are paid on a time basis—by the hour, week or month. It is possible, however, to compare yearly earnings. In 1899 the 52,818 wage earners in the industry received a total wage of \$27,084,000, an average of \$512 per wage earner per year. In 1929 the yearly average was \$1250, or nearly two and one half times as much as in 1899. But in spite of this increase in money wages the trend of real earnings, with 1914 as a base, has been downward. In 1904 real earnings were 21 percent above those of 1914, while in 1919 they were 5.4 percent lower than in 1914. Since then the trend has been upward, but real earnings are still not so high as in 1904 or 1899.

The transition from the hand to the machine process in the glass industry exerted a tremendous influence on the trade union movement in the industry. From 1904 to the present time the records of the labor organizations in the industry tell the story of an endless struggle of organized labor to ward off the effects of the machine, which threatened the very existence of their organizations. Until recently the three major unions in the industry were the National Window Glass Workers, the Glass Bottle Blowers' Association for workers on bottles and jars and the American Flint Glass Workers' Union for pressed and blown ware. The attitudes of these organizations toward the machine have not been the same, and the results of their struggles against its invasion have proved to be very different. The National Window Glass Workers, in spite of the inroads of machinery on the hand plants, particularly the cylinder drawing machine, refused to recognize the significance of machinery and decreed that any member working in a machine plant automatically suspended himself from membership in the union. The rule was finally eliminated at the last convention of the union held in Cleveland in May, 1927. At the same time the union also decided to enter upon an effective campaign to organize the ma-

chine plants in order to retain their membership. But the change of heart came too late; and when the campaign to organize the machine plants failed, the executive board of the union met in June, 1928, and formally disbanded the organization. With the disappearance of this union there disappeared one of the most highly skilled and highly paid group of artisans. Not hampered by any progress in the industry and conscious of their skill and power, the window glassworkers had successfully developed the policy of confining their trade to a small group of workers and their families. No one but the nearest kin of a blower or gatherer could ever become an apprentice to either, and the number of apprentices in the trade had been strictly limited. With this policy also went the rigid rule of strict limitation of output on the part of the workers. It was this situation as much as the natural trend of progress which probably hastened the advance of machinery in the making of window glass, resulting in the complete elimination of hand production.

The bottle blowers' and the flint glassworkers' organizations did not declare open warfare on the machine. From the very beginning their method of struggle had been an attempt to adapt themselves to it and to keep their organizations intact by retaining jurisdiction over the machine operators. In 1914 the bottle blowers went so far as to change their constitution from a craft to an industrial form of organization and proceeded to organize within their fold the unskilled trades, such as glass packers, batch workers and others. Unquestionably this attitude toward the machine on the part of the two unions saved their organizations from sharing the fate of their brothers in the window glass trade. Although not unscathed and with a considerable diminution in prestige and in the ranks of their membership, the two organizations have managed to survive a succession of invasions by machines such as no other trade has experienced in recent years.

If the machine has worked havoc among the glassworkers and their organizations it has not been without its salutary effects in other directions. This is particularly true in the case of child labor. Prior to the introduction of machinery the glass industry was one of the greatest exploiters of child labor. This was especially the situation in the bottle and pressed and blown ware branches, for very few children had been employed in the making of window glass and none in plate glass. In 1899 of the total of 40,916

wage earners employed in making bottles and pressed and blown ware 7035, or 17.2 percent, were minors under the age of sixteen. With the introduction of machinery the child labor situation changed. The mold boys, the cleaning off boys and the snapping up boys were at once dispensed with even in the case of the cruder, semi-automatic machines. The job of "carry-in boys" was retained for some time, but the introduction of the Owens automatic machine with its automatic conveyor completely eliminated all the work formerly done by minors. Although considerable credit for the reduction in the number of children employed in the glass industry is due to the pressure of social legislation which marked the first quarter of this century, it was the automatic machine which contributed more than all other factors combined to the elimination of child labor from the glass industry.

The early history of unionism in the pottery industry was stormy. The employers refused to recognize the potters' union organized in the Knights of Labor, and in 1882 it was put on the black list and all men known to be members of the organization were locked out from the shops of East Liverpool. From 1882 to 1897 the pottery industry was in a constant state of agitation because of ceaseless warfare between the manufacturers and their employees. In 1890 the National Brotherhood of Operative Potters was organized in East Liverpool with a membership of 200. This organization was independent of the Knights of Labor and in 1899 received its charter from the American Federation of Labor. It was not, however, until 1900 that the pottery workers' union was officially recognized by the United States Potters' Association and an agreement concluded between the two organizations, inaugurating a system of collective bargaining which made the pottery industry famous as a sample of industrial self-government established by mutual agreement between capital and labor. The principal points of this agreement were: the establishment of regular procedure for the regulation of rates of wages, hours of work and other labor conditions by means of biennial agreements prepared by a permanent labor committee with equal representation from both organizations; the adoption of a uniform wage rate list for the entire industry; and the adoption of specific rules pertaining to strikes and lockouts, regulation of apprenticeship, sanitary and health conditions and the like. This agreement established peace in the industry, and for more than twenty years the pottery industry did not have

a single strike or other labor disturbance. The rapid introduction of the casting process in making sanitary ware was chiefly responsible for the strike which occurred in 1922. The strike was lost by the workers and was officially called off in 1923; the employers agreed to employ such union men as they could find room for at a general reduction of 10 percent in the wages prevailing before the strike.

Although collective bargaining has been retained, the power and prestige of the workers' organization have been greatly reduced. In 1928 the brotherhood reported only 6900 members, which is less than 20 percent of the total number of wage earners in the industry in 1927. The pottery workers' union is strictly a craft organization and is limited to skilled workers only; it completely ignores the semiskilled and unskilled workers employed in the industry.

From the point of view of the health of the workers the production of pottery ware may be classified as a hazardous industry. The causes which are responsible for the prevalence of occupational diseases among the pottery workers are traceable to dust and to lead poisoning. The former pervades all the processes wherein potters' clay and flint dust are in use. The dangers of silicosis and lead poisoning in the pottery industry were early recognized by the Home Office of Great Britain, which from time to time issued regulations aiming to minimize these dangers. As a result of this campaign the Home Office reported only 47 cases of lead poisoning among the pottery workers in 1924 as against 200 in 1900. In the United States an exhaustive study of lead poisoning in the pottery industry was made in 1911 by Dr. Alice Hamilton, whose complete survey was published as *Bulletin* no. 104 of the United States Bureau of Labor. A more recent study was made by the United States Public Health Service and published in 1921. Both reports call attention to the existence of unsatisfactory conditions in a large number of pottery shops; little or no precautions are taken to protect the workers against the dangers of silicosis and poisoning from lead glazes. The American pottery manufacturers are inclined to use larger percentages of lead in the preparation of their glazes, yet very little or no instruction is given to the workers concerning the hazards of their work or the habits they should form as precautions against lead poisoning. In 1911 the Brotherhood of Operative Potters introduced a system of limited death benefits for their membership, because the insurance companies were

charging very high rates on account of the hazards to the pottery workers. In 1913 the brotherhood also organized a tuberculosis fund, in the management and operation of which the United States Potters' Association later joined by adding an endowment of its own. There has, however, been some improvement; according to brotherhood reports the average age of deceased potters in 1915 was 41.33 years compared with 55 years in 1928, while the proportion of deaths from tuberculosis declined from one third to one eighth.

Industrial hazards in the glass industry are considerable. The workers inhale poisonous and irritating dusts while mixing the batch, aggravated by the danger of silicosis from silica. There is much danger from the intense heat, smoke and gases from the furnaces, while the glare produces eyestrain. The tuberculosis rate is high. Lead poisoning occurs from the use of paints in shops making decorated ware. In 1925 the accident severity rate involving permanent disability was 1.00 compared with the general average of 1.20 and higher than the average for accidents involving temporary disability. In recent years there has been an influx of women and children into the industry, particularly in cut glass shops, where they work over steel wheels and are exposed to the dangers of speed up, stooping positions and nervous tension as well as to the danger from fumes and burns due to the considerable use of hydrofluoric acid.

As has been previously stated, the commercial production of glass and pottery in 1914 was concentrated in five nations. The World War changed the situation completely. German exports of chemical, scientific and optical wares were cut off and the Allies compelled to manufacture their own supply. Imports by the United States almost ceased, while exports increased tenfold. Factories were built in Latin America, Australia, China and Japan; the last named country in particular organized its glass and pottery industries on an export basis and struggled aggressively for foreign markets. After the war Czechoslovakia became an important factor in foreign trade; intense specialization and the most modern technique prevail alongside of small shops and home work in certain branches, and most of the product is exported. Czechoslovakia is the only country in which glass and pottery exports are an important factor in the national economy. Germany in 1929 imported \$8,500,000 of glass products and exported \$60,250,000; it imported \$3,900,000 of pottery prod-

ucts and exported \$35,700,000. In the same year Great Britain imported \$32,000,000 of glass products and exported \$11,000,000; it imported \$11,600,000 of pottery products and exported \$30,600,000. Over one half of British exports go to the dominions, while the bulk of German exports go to other European countries. All the chief producing countries adopted modern machinery and plant capacity was overdeveloped, leading to the raising of tariffs and attempts to control export prices, such as the Belgian machine glass cartel. Another cartel of European plate glass manufacturers has successfully stabilized prices and limited output. In the United States both the glass and pottery industries have had the benefit of heavy tariff protection.

Glass and pottery production in the United States since 1914 has more than doubled. The value of glass products rose from \$123,100,000 to \$283,921,000 in 1929, and of pottery from \$36,900,000 to \$108,131,000. The most important items in pottery were: white ware, \$31,568,000; vitreous china or porcelain fixtures, \$27,886,000; porcelain electrical supplies, \$21,349,000; hotel china, \$11,081,000; art pottery, \$2,211,000. Plate glass, valued at \$51,840,000, was the most important glass product; medicinal and toilet containers, \$32,670,000; bulbs for electric lamps, \$30,758,000; other electric and gas goods, \$9,438,000. The chief factors in the growth of the glass and pottery industries were rising standards of living, the increase in building construction and the expansion of the automobile industry. Exports and imports, while higher than in 1914, remained fairly constant between 1926 and 1929. Exports of glass products in 1929 amounted to \$10,931,000 and imports to \$13,993,000, and of pottery to \$5,159,000 and \$18,803,000 respectively. The imports consisted largely of decorated china, porcelain and glass-ware—the more artistic products which were once the staple of the glass and pottery crafts.

GLASSON, ERNEST DESIRE (1839–1907), French jurist. Glasson studied at Strasbourg under Aubry and Rau, the celebrated commentators upon the French civil code. At the University of Nancy he held the chair of Roman law and at the University of Paris that of civil procedure. His lectures were clear, full of life and interest; enriched by his knowledge of English procedure and of the services it had rendered

to the development of substantial law in that country, he was able to make even the subject of procedure attractive. At the École Libre des Sciences Politiques he also lectured on comparative legislation, and Taine came to hear him. Glasson's two chief works are his *Histoire du droit et des institutions politiques, civiles et judiciaires de l'Angleterre comparées au droit et aux institutions de la France depuis leur origine jusqu'à nos jours* (6 vols., Paris 1882-83) and *Histoire du droit et des institutions de la France* (8 vols., Paris 1887-1903). Other essays confirmed his reputation, notably *Étude historique sur la clameur de haro* (Paris 1888). A truly encyclopaedic mind, Glasson contributed to the spread in France of a taste for comparative studies and of an interest in Anglo-Saxon institutions. He was a great admirer of British traditionalism and the historic evolution of English law yet preferred the clear and systematic synthesis of legal currents which had formed French law. Although transcended by later publications his work still remains noteworthy.

HENRI LÉVY-ULLMANN

Consult: Morizot-Thibault, Charles, "Notice sur la vie et les œuvres de M. Ernest Glasson" in *Académie des Sciences Morales et Politiques, Séances et travaux*, n.s., vol. clxxii (1909) pt. ii, p. 1-49.

GLEASON, ARTHUR HUNTINGTON (1878-1923), American publicist. After graduating from Yale, Gleason shared, notably as one of the editors of *Collier's Weekly*, in the part the American periodical was playing in the civic ferment of the times. He served in the World War and for six years was close to the struggle, writing first of the men in the trenches and then of the peoples under the stress of war and reconstruction. The first of his three books on England, *Inside the British Isles* (New York 1917), portrayed how a loosely united empire organized for conflict. The later volumes, *British Labor and the War* (with Paul U. Kellogg, New York 1919) and *What the Workers Want* (New York 1920), traced the new economic tendencies in the older English political idealism. The entire trilogy interpreted the emergence of British labor in the midst of the World War in the light of a workers' movement as significant for democracy as was the rise of the middle classes a

century before at the close of the Napoleonic conflict. In the idea of production for use and of work for service he saw a changing basis of civilization. His disparaged prophecies of the rise of the British Labour party were realized and at his death Premier MacDonald recognized him as its outstanding interpreter in America. Upon his return to the United States he dealt with economic, racial and religious cleavages underlying the surface of post-war prosperity. He had previously had a hand in the inception of the American cooperative movement, the League for Industrial Democracy and the Foreign Policy Association; now he did pioneer work in workers' education and in helping to formulate a miners' program for nationalizing the coal industry. His personal contacts and his writings had creative influence because of the incandescent simplicity with which he handled truths that men might take to heart and because of a poet's genius for crystallizing what they vaguely strive for.

PAUL U. KELLOGG

GLOSSATORS. The glossators were a famous school of Italian jurists, whose creative work at Bologna was done between the early part of the twelfth and the middle of the thirteenth century. During the early Middle Ages legal studies in the west had never been completely abandoned and gradually old schools were revived and new schools established. Pavia became the chief school of Lombard law; while for the study of Roman law Ravenna and Bologna were the main centers. Odofred, the Bolognese jurist, writes that the success of the school of Roman law at Ravenna was due to its use of Justinian's law books and that at a later time Bologna's eminence was equally caused by its possession of these manuscripts, which had been transferred thither from Ravenna. Other factors, such as its central geographical position in a region favorable to the spirit of renaissance, its judicial and commercial importance and its enjoyment of political influences friendly to legal studies, also furthered the rise of Bologna as the most illustrious of all the mediaeval Italian law schools; but the chief cause was the genius, the scientific method and the achievement of its teachers, the glossators. Assimilating and adapting the main traditions of east and west in scholarship and education and at the same time combining these elements with the aims and methods of the con-

temporary Renaissance movement, the glossators not only laid the foundations of a European legal science but influenced the spread of Roman law in all the regions of Germanic and feudal custom.

The method of the gloss, or textual interpretation, followed by the Bolognese school of glossators, had already been employed in the study of Lombard and Roman legal texts. The main achievement of the Bolognese glossators was the application of this method for the first time in history to the texts of the Justinianian codification; the work of interpreting these texts by the glossatorial method gave the school both its name and its unique position in the history of legal science.

When the school was in its beginnings there was special need of literal interpretation as a means of arriving at a correct text of each one of the several parts of Justinian's legislation, the Digest, Institutes, *Codex* and *Novellae*. There existed, for example, several texts or readings of the Digest known as *literae*; the manuscripts of the Digest earlier than the famous Pisan manuscript or differing from it were called the *Litera vetus* (*Litera communis*, *Litera antiqua*). The Pisan manuscript itself was known as the *Litera pisana*, while a composite text, formed by a collation of all the other texts for school use at Bologna, was known to the glossators as the *Litera vulgata*.

The glossators regarded the several portions of Justinian's codification as an entirety and treated these texts as forming with certain other legal sources, to be mentioned presently, the *Corpus juris civilis*. In studying manuscripts of the Digest they employed a threefold division of its contents: the *Digestum vetus* to book xxiv, title 2; the *Infortiatum* from the *Digestum vetus* to the end of book xxxviii; and the *Digestum novum* containing book xxxix to book l inclusive. They distributed the matters of the *Corpus juris civilis* into five volumes. In the first three volumes they placed the three parts of the Digest formed in the manner already explained and in the fourth volume the first nine of the twelve books of the *Codex*. The fifth volume contained all the remaining portions of the *Corpus juris civilis*, some of which were Justinianian, namely, the Institutes, the *Novellae* in Latin (*Authenticum*) and the remaining three books of the *Codex* (*Tres libri*); and some of later date, namely, the text of the Lombard feudal law (*Liber feudorum*) and several laws of the emperors Frederick I, Frederick II and Conrad.

As applied to the Digest and also to the other parts of the Justinianian codification the gloss was at first only a short interpretation or explanation of difficult single words in terms of an equivalent; this explanation was placed above the word between the lines and was called an interlinear gloss. In the hands of the jurists the gloss assumed, however, a second form, the marginal gloss; for when the gloss was an explanation of a passage, an entire *lex* or a legal principle embodied in the text it was placed on the margin. To each gloss, whether interlinear or marginal, the jurist affixed his initials or some other mark of identity; and as the work of the school progressed the gloss became increasingly elaborate and lost much of its original significance. The gloss not only embodied critical notes on the variant readings (*variantia*) of different manuscripts (*literae*), but in order to elucidate a particular point it brought together parallel passages (*loci paralleli*); and when these passages were in conflict (*antinomia*) it sought either to reconcile them or to choose the preferable one. Becoming more and more the exposition of the results of the master's researches the gloss finally developed into a genuine commentary with all its proper appurtenances and variations. It not only took the forms of a summary (*summa*) and the stating of illustrative cases (*casus*) but it also became the deduction of a genuine maxim (*brocardus*) and the discussion of concrete legal problems (*quaestiones*).

The beginnings of the glossatorial school at Bologna date from the end of the eleventh or the first years of the twelfth century. Although Pepo, a Pisan jurist who had migrated to Bologna, was the first of the glossators, the true founder of the school was Irnerius (*q. v.*). Irnerius combined in his teaching both theory and practise and moreover covered in his glosses the whole field of the Justinianian texts. He was followed by Bulgarus, Martinus, Jacobus and Hugo, the famous Four Doctors (*q. v.*), whose labors constituted perhaps the most brilliant stage in the history of the school. Johannes Bassianus and Rogerius were pupils of Bulgarus and were the teachers of Azo (*q. v.*) and Hugolinus. Azo rose into a position of the highest authority. His *Summae* of the Institutes and the *Codex* superseded all similar productions of the school. In legal studies it was treated as being quite as essential as the text of the *Corpus juris civilis* itself, while in the realm of practise it acquired an equal fame. Azo's eminence was recognized throughout Europe. Bracton has derived from

Azo's works some of those jurisprudential ideas which helped him in the writing of the greatest mediaeval treatise on the laws and customs of the realm of England. Various other distinguished jurists belonged to the school of the glossators and contributed to the growing mass of its literary productions; among them were Placentinus, Vacarius (*q. v.*), Burgundio, Carolus of Tocco and Roffredus of Benevento. The last of the prominent glossators, Accursius (*q. v.*), is also the most famous of them all. The gloss of Accursius, which as the *Accursiana* or *Ordinaria* was distinguished from all the other glosses produced by the school, demands special notice.

At the time when the school had its beginnings the intent of the glossators had been to base study and practise upon the texts of Justinian's codification as the primary and pure sources of the Roman law; and the gloss was regarded therefore as being merely an interpretation and elucidation of them. During the progress of the work of the school, however, this original policy was largely displaced by the growth of a vast glossatorial literature in which the sources of the pure Justinianian law were increasingly adapted to the current practise of the courts. In the wealth of its details and even more in the variety of the juristic opinions which it embodied the accumulated glossatorial learning of a century and a half became, however, confusing not only to practitioners and judges but also to students and teachers; they found it difficult and often impossible to make their way through the complicated maze which generations of scholars had established. What was needed therefore was a comprehensive and orderly collection of glosses in which the whole mass should be clarified by a master's hand; this was the great achievement of Accursius. The *Accursiana* supplanted in the schools and in the courts alike all the other glosses; and within the province of jurisprudence it represented in fact the whole meaning of the Bolognese school. The gloss of Accursius was held by the courts to be the law itself, a proof that the glossatorial school having accomplished its work was already in process of decline; and a clear indication that the pure Roman law had been displaced by a mediaeval civil law which although based on the Roman embodied also other elements derived from the legal development of the centuries that had passed since the time of Justinian. In the time of Irnerius the glossatorial school represented the science of the pure Roman law; in the

hands of Accursius the work of the school meant that this scientific treatment of the Justinianian texts had yielded place to the exigencies of thirteenth century practise. The time had come for the emergence of a new juristic method that would give new life to the study of law and at the same time, basing itself upon the requirements of practise, take fully into account not only the Roman law itself but also the manifold legal growths of the Middle Ages, such as feudal and town laws and the ever growing body of canonical law. At the very time when the *Accursiana* was still in its ascendancy a new school of jurists began slowly to displace the glossators. The rise of the school of the commentators was in large measure a reaction against the authority of the Accursian gloss. Although they followed a method essentially different from that of their predecessors the commentators, or Bartolists, based their work in part on the accumulated learning to be found not only in the *Accursiana* but also in the writings of the other great glossators. During the latter part of the fifteenth and in the sixteenth century when the Renaissance jurists, such as Zasius and Cujas, came into prominence they recognized the contribution which the glossators had made to an understanding of the texts in the *Corpus juris civilis*; and although the legal humanists of the Renaissance epoch, studying the Roman texts in the light of philology and history, made notable advances in the science of the pure Roman law, their work and also the work of later civilians was based in many respects upon the pioneer textual studies of the glossators.

Although the term glossators is applied primarily to the civilians, the work of the canonist glossators not less than that of the civilian school of Irnerius formed an important feature of the revival of juristic studies at Bologna and other Italian schools. The Italian school of glossators therefore included, in its widest meaning, the *magistri* who glossed the several canonical texts. After the appearance of Gratian's *Decretum* (c. 1139-41) and Gregory IX's decretals in 1234 canonists glossed these and the other texts that were finally embodied in the *Corpus juris canonici*. Moreover, the canonist writings like the civilian gloss gradually expanded into several distinct types of legal literature, represented, for example, by the *glossa ordinaria* on each of the several texts, such as the *Decretum*, and by systematic *Summae*. Thus the gloss of Johannes Teutonicus, completed by Bartholomaeus Brixienensis, became the *Glossa ordinaria decreti*; while

the *Glossa ordinaria* on the decretals of Gregory IX was written by Bernardus Parmensis.

The writings of the civilian glossators, which covered the whole field of law, embodied many jurisprudential and political theories that have had in all subsequent ages an important influence on thought. These theories, based partly on the Roman texts and partly on mediaeval sources of law, contained elements also of the original thought of the glossators themselves. Each one of the principal theories, as, for example, those in regard to the nature of law and justice, the relation of *jus* to *aequitas* and *justitia*, the meaning of *jus naturale*, the source of political authority, and the relations between the ecclesiastical and secular powers, was the result of the study and reflection of successive generations of civilian glossators. The civilians derived some of their ideas from the canonists, while the canonists owed a heavy debt to the store of juridical and political thought contained in the ever expanding body of civilian glosses. Many theories, based on Roman legal texts and then expanded or modified by the glossators, were carried to a further stage of elaboration by the canonists; while in later times through the commentators and the jurists of the Renaissance these same theories were frequently adapted to meet changed conditions of legal and political life. Of this process in the development of doctrine the Romano-canonical theory of the juristic person, the corporation, is a striking illustration.

The revival of juristic studies in the schools of northern Italy and southern France, but chiefly at Bologna, was one of the momentous aspects of that mediaeval revival of Latin culture, the lesser Renaissance, which culminated in Dante. By their intensive and scholarly study of the Justinianian texts the glossators effected a salvage of one of the most essential elements of ancient Latin civilization; and their influence as teachers of the Roman system of law spread throughout Europe, leading to the establishment of glossatorial schools in many countries, as, for example, at Oxford and Cambridge. This cultural prestige of the Bolognese glossators influenced the judges and legislators of European communities; and, in fact, it was the civilian glossators from Irnerius to Accursius, assisted by contemporary canonists who were glossing ecclesiastical texts based partly on Roman legal conceptions, who set in motion that extensive reception of Roman and canon law which so largely colors the legal history of Europe during the later Middle Ages. The revival of the study

of Roman law by the glossators of the twelfth and thirteenth centuries not only inspired the reception in Europe as a whole but gave to many legal systems long before the close of the mediaeval era a marked and permanent Romanic character. The glossators were a vital legal force not alone in their own time but also, through the widespread influence of their writings, in the ages that followed.

GNEIST, RUDOLPH VON (1816-95), German jurist. Gneist belongs to the universal jurists of the nineteenth century. In his youth he was very much influenced by Savigny and by the romantic school, from which he inherited the idea of the law as a living force and part of the moral order of the universe. Gneist's career as jurist, judge, administrator and political reformer was confined to Prussia. But through extensive travels in Italy, France, England and the United States he gained a profound insight into the structure of foreign legal institutions. This was particularly true of England, to whose constitutional history and government he devoted most of his chief works. Indeed, he practically rediscovered English political institutions for the European continent; he investigated the problems of English administrative law before there was any general awareness that such a body of law existed in England.

Together with the historical school, Gneist conceived law to be undergoing perpetual change. Since his main interest lay in reform

he became a legal publicist in every field, and his participation in politics and administration made it possible for him to put his ideas as a moderate Prussian liberal into immediate action. Particularly in the field of Prussian administrative reform his ideas were epoch making for the development of self-government and the building of the constitutional state (*Rechtsstaat*). By the constitutional state Gneist meant one in which the administration was duly subjected to law and in particular judicial independence maintained; thus he urged administrative courts which, while they should be integral parts of the administration, should nevertheless be entirely independent, at least in the higher instances. By self-government Gneist meant the old English form of government under which the business of administration was discharged by local honorary officeholders. But this "self-government" was not local government because it was integrated in a central administration under the supremacy of Parliament. The failure to achieve this integration was Gneist's explanation of the failure of parliamentary government upon the continent. Gneist held the life of the state to depend upon the personal service of its citizens. Only thus could a bridge be thrown from the state to society, which Gneist, like Lorenz von Stein and under the influence of the Hegelian philosophy of history, saw in unrelaxing tension.

GOBINEAU, (JOSEPH) ARTHUR DE (1816-82), French publicist. Born of old patrician stock, Gobineau began his career as a royalist journalist. In 1849 he entered the diplomatic service, which took him to Berne, Athens, Rio de Janeiro, Stockholm and Rome. His voluminous works, *Les religions et les philosophies dans l'Asie centrale* (Paris 1865, 2nd ed. 1866) and *Histoire des perses* (2 vols., Paris 1869), in which his discovery of Babism was of particular significance, were a product of his travels in the Orient. He attempted a history of civilization in the form of exotic novels and in dramas such as his popular work *La renaissance* (Paris 1877; tr. by P. V. Cohn, New York 1913). His chief opus, however, is the *Essai sur l'inégalité des races humaines* (4 vols., Paris 1853-55; 2nd ed., 2 vols., Paris 1884; bk. i tr. by Adrian Collins, London 1915), which he acknowledged to have been written from the point of view of a conservative Catholic as a polemic against the democratic sentiment then surging in Europe. Because of the Germanophilia of its author the book at first received little attention in France; it was through the circle of Richard Wagner in Bayreuth that its theory of the decadence of Teutonism became popular. His race theory was then readily taken up by the nationalists, who found in it a justification of the French nobility against the Third Republic. Gobineau regarded racial intermixture as harmful and he interpreted the passing of the old families and the rise of the middle class and proletarian strata as auguring decadence. He considered the culture of the white races and especially that of the Teutons as superior to that of the other races and ascribed their culture to outward manifestations of superior innate tendencies. He attempted to disprove the idea that the lower races could ever reach a higher level of civilization by maintaining that civilizations are incommunicable and that every race creates a civilization of its own without any outside contact and influence. He found justification for Aryan superiority in ancient Greece and claimed that European history began only with the Teutonic invasion. He encouraged the cult of ancestor worship as a device by which nations can succeed in preserving their racial purity and thus rule the world. Gobineau's theories have been revived and elaborated by Houston Stewart Chamberlain in Germany and by

other proponents of Nordic superiority in the United States.

Entz (New York 1928) p. 159-62; Sorokin, Pitirim A., *Contemporary Sociological Theories* (New York 1928) p. 222-29; Hankins, Frank H., *The Racial Basis of Civilization* (New York 1926) ch. iii; Hone, J. M., "Count Arthur of Gobineau: Race Mystic" in *Contemporary Review*, vol. civ (1913) 94-103.

GOBLET D'ALVIELLA, EUGÈNE FÉLICIEN ALBERT, COMTE (1846-1925), Belgian historian and sociologist of religion. Goblet was born in Brussels, the son of a general and politician, and took doctorates in law and political science at the University of Brussels. He frequently contributed to a score of journals, particularly the *Revue des deux mondes* and the *Revue de l'histoire des religions*, and from 1874 to 1890 collaborated with the editors of the *Revue de Belgique*. He was a member of numerous scientific bodies; in 1894 he became professor and from 1896 to 1898 was rector of the University of Brussels.

When Goblet offered his first course at the University of Brussels only four chairs in European universities were devoted to the scientific study of religions. The new discipline was encountering determined opposition not only from church leaders and proclerical politicians but also from historians and philologists, who disputed its claim to be a science. Goblet insisted that all facts of religious experience are data for science and that the origin and development of religions may be studied without accounting for supposed supernatural influences. He divided the science of religion into hierography, the history of religions; hierology, the psychology of origins and development; and hierosophy, the philosophy of religion. He was especially interested in hierology. At first he supported Tylor's animistic theory of the origin of religion but later, confronted by the complex data of early religions and influenced by C. P. Tiele and Albert Réville, he enlarged the meaning of animism to include necrolatry, spiritism and naturism. In seeking to formulate a law of religious

development he used the comparative method. Although he defended this method he recognized its defects and insisted that final conclusions can be safely made only after considering the findings of all auxiliary sciences—prehistory, ethnography, history, folklore, philology, archaeology, psychology and sociology. Like all scholars in this early phase of the science he defined religion in terms of relation to the supernatural. His Hibbert lectures of 1891 are a good illustration of his method.

He made his scholarly researches the basis of a public religious policy. He urged tolerance, sympathy and understanding among representatives of all religions and cultures and to this end advocated the extension of the teaching of the history of religions throughout the public educational system. He served a number of terms in the Belgian parliament and from 1892 to 1894 was the liberal leader in the Senate.

In 1871 he had won the prize of the Société des Amis de la Paix of Paris for his essay on disarmament. During the World War he conducted an active propaganda to enlist pacifists into the patriotic cause on the ground that a decisive Entente victory was the only way to achieve a lasting peace, and he served in the wartime cabinet.

A. EUSTACE HAYDON

Important works: *L'évolution religieuse contemporaine chez les Anglais, les Américains et les Hindous* (Paris 1884), tr. by J. Moden (London 1885); *Introduction à l'histoire général des religions* (Brussels 1887); *Histoire religieuse du feu* (Verviers 1887); *L'idée de Dieu d'après l'anthropologie et l'histoire* (Brussels 1892), tr. by P. H. Wicksteed as *Lectures on the Origin and Growth of the Conception of God as Illustrated by Anthropology and History*, Hibbert Lectures, 1891 (London 1892, 2nd ed. 1897); *La migration des symboles* (Paris 1891), English translation (London 1894); *Creynances, rites, institutions*, 3 vols. (Paris 1911); *Désarmer ou déchoir, essai sur les relations internationales* (Brussels 1872); *Le vrai et le faux pacifisme* (Paris 1917), English translation (London 1917).

GODEFROY, DENIS and JACQUES, jurists Denis Godefroy (1549-1622) was a Huguenot jurist who in 1580 fled from France to Geneva, where he became a professor of law. After a short unhappy venture into practical affairs as bailiff of several villages he spent the rest of his life as professor of law at Strasbourg and Heidelberg. He was also an editor and commentator of ancient texts. His edition of the *Corpus iuris civilis* (2 vols., Lyons 1583; best ed. Elzevir, 2 vols., Amsterdam 1663) was the first to present Justinian's

law books as a complete typographical entity in the modern form and under their proper name. It displaced the old vulgate text, and if his commentary did not attain the authority of the Accursian Gloss it was nevertheless highly serviceable for the next two centuries. Denis was neither a great textual critic nor a great interpreter, but he was extraordinarily industrious in garnering the fruits of the humanist school, then rapidly declining, and he displayed in addition a keen sense of the practical book.

His son Jacques (1587-1652), a faithful Calvinist, remained in Geneva. He was appointed professor of law in 1619 and became a leading citizen, serving four times as syndic. Jacques' fame rests on a work similar to his father's, his posthumously published *Codex theodosianus* (6 vols., Lyons 1665; improved ed. by J. D. Ritte!, 5 vols., Leipsic 1736-43). This work, however, is a masterpiece of historical and legal scholarship, which places its author second only to Cujas. His text has been superseded, but his commentary is still indispensable for the study of the Roman Empire from the third to the sixth century. Although perhaps not a very great jurist he was one of those astounding men of universal learning whom his period produced. Through thirty years of effort he marshaled all available knowledge of antiquity for the elucidation of the Theodosian code. His other works, which deal with ancient literature, law, history and all branches of theology, are negligible in comparison. He left his mark upon the reconstruction of the Twelve Tables. Among his other important juristic works are *Opera iuridica minora* (ed. by C. H. Trotz, Leyden 1733; new ed. Paris 1806) and *Manuale iuris* (Geneva 1654).

F. DE ZULUETA

Consult: Stintzing, R. von, and Landsberg, E., *Geschichte der deutschen Rechtswissenschaft*, 3 vols. (Munich 1880-1910) vol. i, p. 208-09, 384-89, vol. iii, pt. i, p. 231-32; Godefroy Ménilgaïse, D. C. de, *Les savants Godefroy* (Paris 1873).

GODIN, JEAN BAPTISTE ANDRÉ (1817-88), French social reformer. From his eleventh to his seventeenth year Godin worked in his father's blacksmith shop. Later he became a successful manufacturer of improved heating apparatus, invented and patented a new method of enameling cast iron and became wealthy. About 1842 he became acquainted with the ideas of Fourier and was inspired with the idea of productive cooperation on the model of the *phalanstères*.

When, after the unsuccessful Revolution of 1848, Victor Considérant appealed for means to found a Fourierist colony in Texas, Godin gave 100,000 francs. In 1859 Godin founded a *famillistère* for 1200 persons in Guise (Aisne), which was finished in 1877. In 1882 and 1883 he constructed two similar buildings for 600 persons, each equipped with a cooperative store, children's nursery, school, hospital, dispensary and theater. Health insurance and pension schemes were provided. Later Godin introduced profit sharing and in 1880 concluded a contract admitting the workers to full partnership in what is today a fully cooperative productive society with the largest output of ovens and enamel vessels in France.

Godin was unsuccessful candidate for the Constituent Assembly in 1848, became deputy in 1871, worked for legislation for the protection of women and children and wrote in support of trade unions. Just before his death he began to publish a monthly magazine *Devoir*, continued by his widow.

V. TOTOMIANZ

Important works: *Le gouvernement, ce qu'il a été, ce qu'il doit être* (Paris 1883); *Mutualité sociale et association du capital et du travail* (2nd ed. Paris 1891), tr. by L. Bristol as *The Association of Capital with Labor* (New York 1881); *La richesse au service du peuple* (Paris 1874); *Solutions sociales* (Paris 1871), tr. by Marie Howland (New York 1886).

F., *Le famillistère illustré* (Paris 1900), tr. by A. Williams as *Twenty-Eight Years of Co-partnership at Guise* (2nd ed. London 1908); Asch, Käte, *Die Lehre Charles Fouriers* (Jena 1914) pt. v.

GODKIN, EDWIN LAWRENCE (1831-1902), American editor. Godkin was born in Ireland and educated at Belfast in the Mill-Bentham-Grote tradition. In 1856 he came to the United States seeking a society sympathetic to liberalism and the ambitions of a youth without powerful connections. He refused a partnership in the New York *Times*, in 1865 founded the *Nation*, an independent news weekly whose incisive editorials and scholarly criticism soon made it a national influence, and in 1883 became editor of the New York *Evening Post*. Neither paper won substantial circulation, but both always powerfully affected informed upper class sentiment. Godkin's writing reflected his superior education, acquaintance with the more mature institutions of British

life and a penetrating mind. He attacked the abuses of reconstruction, corruption under both Grant and Tammany, did pioneer work for tariff, civil service, municipal and election reform and was a leader in the independent movement which helped elect Cleveland. He advocated free trade, colonial autonomy, world peace and the exclusion of government from business and industrial spheres. In all this he echoed the political and economic philosophy of the Manchester liberals. The rise of agrarian and proletarian movements he viewed with contempt as signs of democratic decay. In opposing cheap money, railroad rate legislation and attacks on the use of injunctions against organized labor his usually precise, dignified editorials became violently vituperative. The jingoism of the Spanish American War found him again on the liberal side, denouncing the imperialist wave which he feared would submerge democracy and wipe out civilization. A thoroughgoing supporter of the rights of capital and with strong class feeling, he looked to an intellectual élite to mold and perfect the social order. The development of imperialism and radicalism impaired his faith in democratic ideals and in 1899 he retired, returning to the English aristocratic society he had repudiated as a youth.

ALLAN NEVINS

Works: *Reflections and Comments 1865-1895* (New York 1895); *Problems of Modern Democracy* (New York 1896, 3rd ed. 1903); *Unforeseen Tendencies of Democracy* (Boston 1898).

(New York 1907); Nevins, Allan, *The Evening Post: a Century of Journalism* (New York 1922); Parrington, Vernon L., *Main Currents in American Thought*, 3 vols. (New York 1927-30) vol. iii; Bleyer, W. G., *Main Currents in the History of American Journalism* (Boston 1927).

GODWIN, MARY WOLLSTONECRAFT.

See WOLLSTONECRAFT, MARY.

GODWIN, WILLIAM (1756-1836), English political philosopher. Godwin, the husband of Mary Wollstonecraft and the father of Mary Shelley, filled in his own generation a place of the first importance as the interpreter to England of the French *encyclopédistes*. Trained as a minister in the rigid Calvinist tradition, he retained its love of logic and system. His chief work, the *Enquiry concerning Political Justice* (2 vols., London 1793; 2nd ed. 1796), develops the thought of the prerevolutionary school, especially of Helvetius, with an unflinching logic and an elabora-

tion of method that are his own. He conceived the book chiefly as an answer to Montesquieu and incidentally to Burke, and one may call it the prolegomenon to all future progress. It is an argument for the perfectibility of the human species, a refutation of contradictory theories and an examination of the social and political conditions conducive to this perfection. Starting from an impressionist and individualist psychology he proves to his own satisfaction that education (i.e. social environment) and not climate or innate ideas is the sovereign factor in the formation of character, and reason the guide of conduct. Vice is error and will yield to persuasion. The chief condition of progress is the elimination of the "positive institutions" (priestcraft, aristocracy and coercive legislation) which dwarf and poison the mind. Violence is to be avoided as an offense against reason. His ideal society is complete anarchism, but he regretfully tolerates in the transitional period a loosely knit *laissez faire* democracy, which would federate self-governing parishes. Intensely equalitarian, he permits property only that it may be given away. A communist, however, he was not, for he disliked cooperation hardly less than government. In this book he carries the obligation of "universal benevolence" so far as to disrupt the family altogether, although he afterward modified the doctrine. In his final picture of perfection man has vanquished death and even sleep. History in these speculations is naively distorted and economics forgotten. The book enjoyed a brief popularity and a rather longer influence, which may be traced throughout Shelley's poems and even in the early work of Coleridge and Wordsworth. It is the ablest reflection in the English language of the intellectual ferment of the French Revolution, while the honesty of its reasoning, aided by total lack of humor, exposes the fallacy of its individualist starting point.

Godwin wrote indefatigably; but of his many essays, novels, histories and schoolbooks only *Caleb Williams* (3 vols., London 1794), a romantic novel with a social purpose, deserves to be remembered.

H. N. BRAILSFORD

Consult: Brown, Ford K., *The Life of William Godwin* (London 1926); Brailsford, H. N., *Shelley, Godwin and Their Circle* (London 1913); *The Life of Thomas Holcroft*, ed. by E. Colby, 2 vols. (London 1925).

GOETHE, JOHANN WOLFGANG (1749-1832). Famous as the author of a historical drama (*Götz von Berlichingen*, 1773) and of a novel (*Die*

Leiden des jungen Werthers, 1774), Goethe was hailed at an early age as the leader of an awakened youth, for whom the ideas of Rousseau had pointed the way to a cultural revolution. In 1775 he was summoned by the young duke of Weimar to his court and was soon burdened with official duties. After ten years of this irksome life Goethe escaped to Italy, where the radiation of new influences and scenes brought him to maturity. Upon his return to Weimar in 1788 he assumed the management of the court theater and of the educational system of the duchy. Under the stimulus of his intellectual comradeship with Schiller between 1794 and 1805 his trend toward classicism, first clearly manifested during his sojourn in Italy, was completed and his poetry, no longer the impetuous outpourings of the *Sturm und Drang*, came to reveal the classic harmony which is the mark of the mature Goethe. To the period of his ripened powers belong the stylistically perfect dramas, *Iphigenia at Tauris* (1787) and *Torquato Tasso* (1790); the novel, *Wilhelm Meisters Lehrjahre* (4 vols., 1795-96); the idyll of middle class life, *Hermann und Dorothea* (1798); and the first part of his great life work, *Faust* (1808). Goethe remained in Weimar until his death. At first worshiped by the romantic youth of Germany and later attacked for his admittedly reactionary and quietistic tendencies, he assumed ever more majestic proportions as the cultural leader of Germany. In the last period of his life he engaged in painstaking researches in many branches of natural science, while continuing his activity as a poet. The works of this period include the novel *Die Wahlverwandtschaften* (1809); *Dichtung und Wahrheit* (4 vols., 1811-33), an autobiography treating the period prior to his summons to Weimar; *West-östlicher Divan* (1819), a lyrical poem; *Wilhelm Meisters Wanderjahre* (pt. i, 1821), a continuation of the story of Wilhelm Meister's apprenticeship; and the second part of *Faust*, published only after his death.

Goethe is the most profound and universal of Germany's poets. His imagination draws its sustenance from an immediate intuition of life; it is restrained less by the intellect than by an innate standard of beauty. Ideologically Goethe's poetry is significant in that it represents the first fully conscious embodiment of the modern conception of the individual's relation to the world. His *Weltanschauung* may be described as natural idealism. It rests upon an idealistic faith in nature conceived pantheistically as a living all-oneness perpetually striving toward reason and

held in a state of equilibrium by the polar tension between creative freedom and the operation of eternal law. From this conception Goethe derives a twofold ideal of life: the aesthetically perfect man who achieves an energetic and harmonious reconciliation of the antinomies of life; and the Faustlike man who eternally strives for this adjustment but eternally questions it, since struggle itself and the perpetual striving for an ever higher form of satisfaction become for him the most compelling ideal. Thus Goethe is the first poetic herald of a philosophy of all embracing reverence in many ways opposed to Christianity; his *Faust* has been called the Bible of modern man.

HERMANN A. KORFF

Works: Among the numerous collections of Goethe's complete works, a standard edition is that published at Weimar (50 vols., 1887-1912). Others of recent date are the jubilee edition by E. von der Hellen (40 vols., Stuttgart 1902-12) and the Propyläen edition (48 vols., Munich 1900-31). English translations of most of the works are found in the Bohn Standard Library (14 vols., London 1848-90); a standard translation of *Faust* is that by Bayard Taylor (2 vols. Boston 1871-73).

Consult: Bielschowsky, A., *Goethe, sein Leben und seine Werke*, 2 vols. (new ed. by W. Linden, Munich 1928), tr. by W. A. Cooper, 3 vols. (New York 1905-08); Korff, H. A., *Geist der Goethezeit*, vols. i-ii (Leipzig 1923-30); Kuhnemann, E., *Goethe*, 2 vols. (Leipzig 1930); Simmel, Georg, *Goethe* (Leipzig 1913); Brandes, Georg, *Wolfgang Goethe* (2nd ed. Copenhagen 1915), tr. by A. W. Porterfield, 2 vols. (New York 1924); Gundelfinger, F., *Goethe* (11th ed. Berlin 1922); Francke, Kuno, *A History of German Literature as Determined by Social Forces* (4th ed. New York 1911); Hettner, H., *Literaturgeschichte des achtzehnten Jahrhunderts*, 3 vols. (5th ed. Brunswick 1894-1909) vol. iii; Steinmetz, F. F., *Die pädagogischen Grundgedanken in Goethes Werken* (Freienwalde 1910).

GÖK ALP, ZIYA (1875-1924), Turkish nationalist and sociologist. From an early age Gök Alp was interested in Turkish revolutionary activities. After 1908 he achieved prominence as one of the outstanding figures in the Young Turk party and as a journalist in the nationalist cause. He was associated with and wrote prolifically for the leading reviews, including *Türk Yurtu*, *Yeni Mecmua* and *Küçük Mecmua*. In 1912 he accepted the chair of sociology which was established for him at the University of Istanbul. He was a delegate to the National Assembly in 1923 and a member of its Committee on Public Instruction.

Gök Alp was the theorist of the nationalist movement and as a writer and teacher did a great

deal to prepare the intellectual ground for the recent social reforms in Turkey. His weekly *Genç Kalemler* (Young pens) published shortly after the Young Turk revolution and his collection of poems called *Kızıl Elma* (Red apple) (Istanbul 1914) offered the Turkish people for the first time a sociological approach to their problems and their destiny as a nation and attracted attention to the early history of the Turks in central Asia. Then came "Eski Türklerde, İçtimaî Teşkilât" (in *Millî tettebbü'ler Mecmuası*, no. iii, 1912, p. 385-456), an article dealing with the social life of the early Turkish tribes. At his death Gök Alp left the completed manuscript of *Türk Tarih-i Medeniyeti*, a history of Turkish civilization. His program for national unity and reform was epitomized in the slogan "Turkify, Islamize and Modernize," which was the title of his leading group of articles on Turkish nationalism (in *Türk Yurtu*, nos. 11, 13, 15, 17, and 23). Subsequently he published *Türkçülüyen Islave* (The principles of Turkish nationalism, Angora 1924).

Gök Alp popularized western sociology in Turkey. He was inclined toward the teachings of Émile Durkheim, whose work on the sociological method (*Les règles de la méthode sociologique*, Paris 1895) became, through Gök Alp's political prestige, a sort of Bible for Young Turk thinkers. He himself analyzed existing Ottoman and Mohammedan institutions in the light of the sociological method and presented as the ideal the old Turkish institutions modified to conform with the modern technical achievements of the West.

His most extreme ideas were expressed only to his immediate followers. Some of his radical ideas, such as those against veiling, polygamy and theocracy, were embodied in pamphlets and published anonymously, while others appeared in magazine articles and in his various books. In all of these works he tried to give the Turkish nation an appreciation of its past as well as a realization of its present and future problems.

ÂHMET EMIN

Consult: Deny, J., "Zia Goek Alp" in *Revue du monde musulman*, vol. lxi (1925) 1-41; Rossi, Ettore, "Uno scrittore turco contemporaneo: Ziya Gök Alp" in *Oriente moderno*, vol. iv (1924) 574-95; Hartmann, Martin, "Aus der neueren osmanischen Dichtung II" in *University of Berlin, Seminar für orientalische Sprachen, Mitteilungen*, vol. xx, pt. ii (1917) 86-149.

GOKHALE, GOPAL KRISHNA (1866-1915), Hindu nationalist and social reformer. Gokhale was educated at the Elphinstone and Deccan col-

leges and in 1885 became a professor at Fergusson College in Poona, where he taught mathematics, history and economics. In 1902 he resigned in order to devote himself entirely to politics—he had already been active in the Indian National Congress and had been elected to the Bombay Legislative Council in 1900 and again in 1901. In 1902 he was nominated to the Viceregal Council, where he opposed Lord Curzon's educational policy and became known as a severe critic of Indian government finance, of which he had made a special study. In 1905 he was chosen president of the National Congress, a selection which marked a victory of the moderates over the extremists. He was the leading figure in the new Indian councils established in 1909 by Lord Minto and during the viceroyalty of the latter was continually consulted by John Morley, the secretary of state for India.

Gokhale was the founder and leading spirit of the Servants of India Society, established in 1905. The society, which stood for complete religious toleration, was composed of both Hindus and Mohammedans of the highest ability. The members were expected to surrender all personal ambition, ignore caste distinctions and dedicate themselves to the service of their country in social as well as political work. The purpose of the society was to train national missionaries to work for the unification and self-government of India within the British Empire. Social reform and education were to be the first steps toward the realization of this plan, for, according to Gokhale, they were the necessary concomitants of political freedom. The specific program of the society included the promotion of free compulsory education and of cooperative enterprises, the elevation of women's position and social service and relief work. The society was an influential factor in the early development of Indian nationalism.

In 1912 Gokhale paid a memorable visit to South Africa in order to obtain redress for the Indian agricultural laborers who had been sent there under indenture. His strong and reasoned opposition to the Indian indenture system first attracted public attention to its social and moral evils. He worked on the Royal Commission on Public Services in India from 1912 to 1915, and during those years he also devoted much of his time to championing further the cause of the Indians in South Africa, where the color bar had brought with it social injustice of a deplorable character. Gokhale's speeches and writings have been published under the title *The Speeches of*

the Honorable Mr. G. K. Gokhale (Madras 1908, 3rd ed. 1920).

C. F. ANDREWS

Consult: Bannerjea, D. N., *India's Nation Builders* (London 1919) p. 146-63; Fisher, F. B., *India's Silent Revolution* (New York 1919) p. 87-91.

GOLD is a brilliant, malleable, ductile metal; its density is greater than that of all common metals except platinum, but it is too soft to be used without alloy. Native gold occurs chiefly in two forms: lodes associated with quartz or other non-metallic minerals; and placers, or alluvia, derived from lodes by the erosive action of water. Alluvial gold when not buried under hard layers of lava is clearly recognizable and easily obtainable at or near the surface; placers worked with crude tools thus afforded the earliest sources of gold supply. Gold in lodes is not chemically associated with other minerals; the ore must be merely dug from the lode and crushed or milled to a size permitting recovery through amalgamation with mercury or by the cyanide process. Gold may also be found in chemical combinations with sulphur, tellurium and the like; such refractory ores were the last to be worked, but an appreciable proportion of the present output is derived from them. In recent times gold has been largely derived from the so-called banket, or sedimentary formation, occurring in the Rand.

Gold has been mined from very early times. Ancient civilizations derived their gold from Armenian deposits, mentioned by Strabo; from Chaldean lodes and placers; from the several mining centers of Asia Minor, well known in the fifth century B.C.; from the equally celebrated mines of Macedonia and Thasos, visited and described by Herodotus; and from Egyptian lodes found in the mountain ranges between the Nile and the Red Sea. At the beginning of the Christian era Egyptian mines, although failing, were reputed to produce about 750,000 ounces annually. It is also reported that in Spain during the three centuries of Roman occupation 320,000 ounces were won annually. In late antiquity, however, the mines worked by primitive methods were exhausted, the accumulated stocks of gold were dispersed and gold ceased to function as a circulating medium. The scattering of gold stocks continued through the Middle Ages, so that by the thirteenth century the visible gold supply of Europe probably did not exceed 3,750,000 ounces. In the thirteenth century the active working of mines was resumed, but after Columbus' visit to America the European gold

output became insignificant as compared with the American yield of precious metals. In fact, Charles V suspended the working of Spanish mines in 1535 in order to dispatch miners to the New World. In the sixteenth century gold was also won in Africa on the Gold Coast, in Rhodesia, Madagascar and Abyssinia.

A reasonably reliable record of the world's gold output dates only from the end of the fifteenth century. As may be seen from Table I only 15 percent of the quantity won since then was obtained before 1850. While in 1847 the world's output was about \$29,000,000, it reached \$150,000,000 in 1853 following the Californian and Australian gold discoveries. As gold was then derived mostly from alluvia, the output dwindled to \$95,000,000 by 1883; of this \$80,000,000 was obtained from the United States, Australia and Russia alone. The subsequent rise of output was caused mainly by the discoveries in the Rand district of the Transvaal, although the discovery of the Klondike-Yukon alluvia in 1896 and of the Ontario lodes in 1907 were of material help. Considerable assistance was also rendered by technological improvements, such as the invention of the cyanide process, which is more efficient than mercury amalgamation and permits of the recovery of chemically bound gold, the development of drift mining in alluvial soils located under heavy crusts of lava and the adoption of dredges in working large low grade alluvial deposits. Apart from the setback from 1899 to 1902 caused by the Boer War gold production advanced after 1885 almost without a break to \$470,000,000 in 1915; it declined after that to a new low point of \$319,000,000 in 1922, largely because of the white miners' strike in the Rand, from which it rose to over \$400,000,000 in 1928, 1929 and 1930. It is significant that over a half of the gold won since 1493 was obtained in the first thirty years of the present century.

TABLE I
WORLD GOLD OUTPUT
(In \$1,000,000)

YEARS	TOTAL OUTPUT	AVERAGE ANNUAL OUTPUT
1493-1600	502	4.65
1601-1700	606	6.06
1701-1800	1,263	12.62
1801-1850	787	15.74
1851-1885	4,242	121.21
1886-1900	2,666	177.71
1901-1930	11,862	395.40

Source: Compiled from the *Annual Reports* of the Director of the United States Mint.

The most important gold field in the world has been and remains the Rand district in the Transvaal, an area some fifty miles long by a few miles wide surrounding the city of Johannesburg. During its relatively short life it has contributed almost a quarter of the world's gold won since 1493, and in the post-war years it has been the source of over a half of the world output. The older portion of the Rand reached a peak output of \$156,000,000 in 1912, since which time it has declined by about one third, but the newer portion is still expanding, thus accounting for a continued increase of the total Rand production. Because work has to be conducted at an increasing depth, the present cost of opening a new mine is in the neighborhood of \$9,000,000 and the time required is from six to seven years. For this reason new mines are infrequent, but old companies continue to add to their areas worked and increase their milling capacity. Although since 1913 twenty-seven mines in the old Rand ceased operations and only seven new mines in the new Rand began production, the total output may be expected to increase for perhaps another five years, but after that a decline seems to be inevitable.

TABLE II
OUTPUT OF THE PRINCIPAL GOLD FIELDS

COUNTRY	PERCENTAGE CONTRIBUTION TO WORLD OUTPUT			YEAR'S RECORD OUTPUT

The United States ranked in the twentieth century as the second gold producing country in the world until Canada surpassed it in 1930. Its output became really important with the California gold rush of 1848. In 1883 after the decline of the California output its production was approximately \$30,000,000. In the following thirty years production increased, reaching about \$88,000,000 in 1905 and fluctuating in the neighborhood of \$93,000,000 in the decade 1905

to 1914. In 1915 American mines had a record output of \$101,000,000, a peak from which production declined to about \$42,000,000 in 1930. Of the twenty-five principal producers in 1927 six suspended operations by the beginning of 1930. In Australasia the output reached an early maximum two years after the discovery of gold in the eastern part of the continent. Another peak was attained fifty years later in 1903, after gold had been found in western Australia, the source of the greater part of present production; but the decline which set in then still continues. Russia was the chief gold producer in the first half of the nineteenth century. In 1741 gold was discovered in the Ural Mountains and in 1829 rich placers were found in Siberia; of these the Lena gold field is the largest reservoir of alluvial gold in the world. Output which had been increasing until 1910 has declined since but has picked up in recent years with the restoration of political tranquillity. In Canada gold was discovered in 1823, but its output was insignificant until more important deposits were found in 1855. Later history comprises the Klondike boom and the discovery of the Ontario lode, which at present accounts for over 85 percent of the Canadian output. Production has been on the increase since 1909 and may be expected to expand in the future.

Although the past increase in the production of gold has been phenomenal, there is reason to believe that, unless there is some outstanding new discovery, 1915 will prove to have seen the zenith. Within the next ten years a shortage of gold, which has in the past caused recurrent apprehensions, may be expected to materialize. Apart from the Transvaal the world gold output declined from \$282,000,000 in 1915 to \$184,000,000 in 1930. The Transvaal production is represented to the extent of 98 percent by the Rand, whose decline may be anticipated to begin in 1935 or 1936. The Rand is really a unique phenomenon; no other single gold field has as yet added more than some \$25,000,000 to the annual output and the probability of finding another Rand is small, even though there was once some sign of it on the Gold Coast, where banket also exists. While the Canadian output is certain to increase and the production of Russia and Mexico may possibly be larger than in the past decade, their contribution to the world output is not so great as to affect its trend appreciably. There is still room for technological improvements for reducing the cost of gold production; but not much more gold can be won

from the type of ore worked at present, since the proportion of gold recovery is now from 90 to 95 percent. The hope of averting the threatened decline in the annual yield of gold thus depends upon some outstanding new discovery. While it is not reasonable to dismiss such a possibility, it should be borne in mind that the world is now much more prospected for gold than it has ever been, the unprospected regions comprising mainly the desert areas of Australia, some regions in Central Asia and around the Sudan and the tropical localities at the headwaters of the Amazon and Orinoco rivers.

Not all of the newly won gold is available for monetary purposes. A part of it is used in the arts; in the manufacture of jewelry, rings, watch cases and chains, spectacle frames, pens, gold teeth and fillings, gold lace; in gilding, chemical and photographic work and the like. Another part is exported to India, China and Egypt, where it is turned into jewelry or hoarded, thus representing a net deduction from the stock of monetary gold. The total non-monetary demand for gold is by no means inconsiderable; according to estimates it has absorbed to date 48 percent of the total output. In Table III an attempt is made to collate data for the non-monetary consumption of gold in the last ninety-five years in order to arrive at an estimate of the addition of gold to the monetary stock. No great accuracy can be claimed for the figures in this table except for world output. The data on industrial consumption of gold are probably the least reliable: a great deal of old gold, including coined gold, is used in the arts and not all of the new gold once used in the arts is irretrievably lost for monetary purposes. The table is, however, suffi-

ciently accurate to afford a general idea of the trends in gold consumption. The proportion of total output remaining for monetary uses is now greater than it was a hundred years ago, and the relationship between the different non-monetary uses has undergone considerable change. The industrial consumption of gold has not grown so rapidly as the output, while the share of the current output absorbed by India has virtually doubled, the absolute amount increasing from \$12,000,000 to nearly \$95,000,000 per annum.

Since during the nineteenth century the world increasingly adopted the gold standard, the amount of annual additions to the stock of monetary gold has become of considerable importance as a factor influencing through the quantity of money in circulation the rate of economic development. It has been shown, for example, that the trend of commodity prices, which had been rising in the years 1850 to 1873, declining in 1873 to 1895 and rising once more from 1896 to the opening of the World War, is distinctly correlated with the increases in the stock of monetary gold, which during these three periods amounted to 4.0, 1.6 and 3.7 percent per annum respectively.

On the experience of the period from 1850 to 1910 Gustav Cassel has shown that to keep wholesale commodity prices stable the annual addition to the world's total stock of gold should be 3 percent. Operating with the stock of monetary gold rather than the total gold stock Kitchin arrived at approximately the same percentage. It happens that the world's rate of economic development for that period, as judged by the production of basic commodities, was also about 3 percent, which is equivalent to allowing 1 per-

TABLE III
WORLD PRODUCTION AND EMPLOYMENT OF GOLD, 1835-1929
(In \$1,000,000)

PERIODS	WORLD OUTPUT	NON-MONETARY DEMAND				ADDITIONS TO MONETARY GOLD STOCK	MONETARY GOLD STOCK AT END OF PERIOD

Source: Adopted from League of Nations, *First Interim Report of the Gold Delegation of the Financial Committee* (Geneva 1930) p. 114-17, and *Selected Documents on the Distribution of Gold Submitted to the Gold Delegation* (Geneva 1931) p. 66.

* This table ignores most of the gold in private hoards, especially in Asia and Africa. The world total shown in this table differs from that of the League because it excludes India and Egypt.

cent for the increase of population and 2 percent for improvement in the standard of living. It is, broadly speaking, correct to say that in periods when gold money advanced at a rate greater than 3 percent commodity prices rose and business greatly improved, while when the rate was less than 3 percent prices fell and business was less prosperous.

But this experience cannot be made to apply to conditions today. During the sixty years since 1850 the world was increasingly passing from the silver to the gold-silver and then to the gold standard. Moreover, the employment of gold was increasingly economized by the greater use of banknotes, checks and other credit instruments. Toward the end of the period the rate of increase in gold money required to keep prices stable was probably nearer 2 percent than 3 percent. Since 1914 an extraordinary economy has also been effected by the transfer of gold money from the pockets of the public and from other banks to the vaults of central banks and treasuries; that is, gold, which while in circulation remained relatively ineffective, was made the basis for note issues, bank deposits and other forms of currency of a superior velocity. The extent of this change can be seen from Table IV. During those seventeen years central banks and treasuries have withdrawn a very considerable proportion of gold formerly in circulation or in other banks besides absorbing about 55 percent of the new gold produced, the balance of which was taken by the industrial arts and the hoarding countries of the East. Thus while the world's stock of monetary gold increased at an average of something like 1.75 percent per annum, the

amount in central banks and treasuries rose from 1913 to 1924 by about 6 percent per annum and then by about 3.3 percent annually. The fact that so large a proportion of gold has been secured by central banks and treasuries indicates that one of the greatest means of economizing gold has already been realized. Not much further assistance can be expected from this source, unless new economies are made possible by a growing substitution of deposit for banknote circulation and by a reduction in the legal or customary rates of reserve for the note and deposit liabilities of central banks.

Table IV indicates also the change in the distribution of monetary gold between countries. South American countries and Japan have become much larger holders of gold than they were before the war. The most radical change, however, is represented by the increase of the monetary gold stock of the United States from less than a quarter of the world stock to more than a third. Unlike Germany and Great Britain, both of which lost gold as compared with 1913, France increased its gold holdings and more than tripled the amount of specie functioning as the monetary reserve. Since 1928 the international flow of gold tended to accentuate the position of the United States and France as holders of the largest stocks of monetary gold, these countries being the main recipients of German reparation moneys. This "maldistribution" is partly responsible for the slump of prices in 1929 and the following years and unless corrected by the adoption of appropriate political, banking and investment policies is apt to prove as important a factor in influencing the

wholesale price level and associated economic phenomena as the absolute additions to the stock of monetary gold.

A shortage of gold for monetary uses has been anticipated ever since the end of the war. It is for this reason that the Genoa conference has recommended the return to gold on the basis of the gold-exchange standard rather than to the pre-war gold standard. Its advice to central banks to prevent gold from returning to domestic circulation has also been largely followed, as may be seen from Table IV. But even such economies have not assuaged the fear of a "scramble for gold" by central banks and of a future shortage. The delegation appointed by the Financial Committee of the League of Nations to deal with the question estimated in 1930 that on the basis of a 2 percent annual increase in the amount of circulating media and a 33 percent cover for notes and sight liabilities of central banks a shortage of gold may be expected to set in by 1938, if the forecasts of future gold production and of non-monetary demand for gold are at all accurate. The question of the future of gold as the basis for money is thus raised. It is, however, doubtful whether it will be practicable, even if the desire should exist, to take gold off its solitary pedestal and one may safely assume that a generation will pass before an effective substitute is devised. Effort should be concentrated in the direction of better distribution of gold reserves between central banks and the effecting of further economies in its use. In this connection should be mentioned the proposal to abolish legal reserve requirements for central banks and to restrict the use of central bank reserves to the settling of deficits in the balances of international payments.

GOLDENWEISER, ALEXANDER SOLOMONOVICH (1854-1915), Russian lawyer and criminologist. When a student in St. Petersburg Goldenweiser attended the lectures of Vladimir Solovyev, idealistic philosopher, under whose influence he became a follower of Hegel. Later, in middle life, he turned to Herbert Spencer and devoted an essay to an exposition of his philosophy. As an attorney he regarded himself and his colleagues as the advance guard of social progress and defenders of the rights of man. He won his early fame in criminal cases, but finding the human tragedies attending this practise unendurable he soon abandoned it, devoting himself henceforth to civil law. In this field his reputation was second only to that of Passaver; his speeches in court while not always brilliant were distinguished by a comprehensive erudition and an infrangible logic.

Goldenweiser's real interests, however, lay outside the court room. He took an active part in the work of the Kiev reformatory for boys and attended religiously the sessions of the International Prison congresses. In Kiev, where Goldenweiser practised law for thirty-eight years, his fame acquired mythical proportions. Attuned as he was to all human suffering, the events of the World War broke his optimistic spirit and hastened his death.

GOLDIE, SIR GEORGE DASHWOOD TAUBMAN (1846–1925), British colonial administrator. Goldie went to west Africa as a result of his family's interest in a company trading at the mouth of the Niger River. In order to eliminate competition from the palm oil trade he consolidated British trading interests into the United African Company and had agents negotiate treaties with native chiefs, exchanging protection for trading monopolies. In 1886 a royal charter was granted to the Royal Niger Company, after Goldie had threatened to seek foreign protection. Goldie availed himself sparingly of the political rights conferred by the charter, administering through native chiefs (some of whom were subsidized) in accordance with native law and custom, except as to slavery and trade, and levying no direct taxes. These policies anticipated the methods of colonial administration since developed by Sir Frederick Lugard. Goldie's company held a virtual monopoly of commerce and paid consistent dividends, a result not achieved by other African chartered companies. He required that all his agents give bond to impart no information of any kind with regard to company activities. The company extended control into the interior, warding off French and German encroachments, until the final partition of the Niger area in 1898 secured to the British more than half the 500,000 square miles originally covered by the company's vague treaties. Goldie retired from the management of his company in 1899 when Great Britain assumed direct political control of Nigeria. In compensation he secured reimbursement of a large share of the company's capital expenditures and extensive long term mining rights. His accomplishment represents a pure case of imperial expansion developed directly out of the interests of a particular commercial undertaking.

GOLDSCHMIDT, LEVIN (1829–97), German jurist. Goldschmidt was the greatest authority on commercial law during the nineteenth century in Germany and perhaps in the world. When he commenced his labors German commercial law, which had long been under the predominant influence of the Italians, had gradually begun to attain independence. Frederick the Great's *Allgemeines Landrecht* of 1794 had codified Prussian commercial law, but German industry and commerce had expanded greatly since that time. A new era opened with the adoption of the German bills of exchange law of 1847, followed by the general German commercial code of 1861, which became the law of the North German Confederation and later of the German Empire. While these legislative labors were proceeding, Heinrich Thöl had begun to elaborate the principles of a German science of commercial law; but it seemed to Goldschmidt that the latter was founding it dogmatically upon an essentially Roman basis. Goldschmidt began by demanding the severance of commercial law from the dominance of purely Roman legal conceptions. He then proceeded to outline and execute a program based upon historical research, comparative method and economic factors.

Goldschmidt began to realize his program practically when in 1858 he founded the still flourishing *Zeitschrift für das gesamte Handelsrecht*. In 1869 a federal Supreme Court of Commerce was founded in Leipsic, and the following year Goldschmidt entered it and began a great career as a commercial judge in his interpretation of the general German commercial code of 1861. When in 1875 he also became professor at the University of Berlin, he was enabled to exert a great influence upon the coming generation of teachers of commercial law.

The scientific monument of Goldschmidt's work is his great *Handbuch des Handelsrechts* (2 vols., Erlangen 1864–68; 2nd ed. 1875–83; vol. i, 3rd ed. Stuttgart 1891). In the second edition the treatment became more thorough and the third edition of the first volume is entirely confined to a history of the mediaeval commercial law of southern Europe. The work had thus been converted into a series of comprehensive monographs; but in it Goldschmidt had outlined

the method that should obtain in the study of commercial law and laid down the fundamental principles of the subjects he treated.

Goldschmidt also wrote numerous studies of a Romanistic character on the civil law, which for the most part are collected in his *Vermischte Schriften* (2 vols., ed. by H. V. Simon, Berlin 1901). His notable studies upon the Roman law of possession should be particularly mentioned. Despite his objections to Romanistic concepts he still held firmly to them upon many questions of the positive law, but by the general tenor of his whole work started a current of opinion against regarding them as exclusive. Consequently Brunner's Germanistic investigations of securities and Otto Gierke's investigations of commercial companies could start from his work and give commercial law a still broader basis.

GOLDZIHHER, IGNAZ (1850-1921), Hungarian orientalist and Islamic scholar. Born of a Jewish family, Goldziher studied at Budapest, Berlin, Leipzig and Leyden, visited the Orient and spent most of his life in Budapest as professor of Semitic languages in the university. After two highly acclaimed studies in Biblical criticism he concentrated his attention upon Arabic and Islam. His chief works are *Die Zähiriten* (Leipzig 1884), *Muhammedanische Studien* (Halle 1889-90), *Vorlesungen über den Islam* (Heidelberg 1910) and *Die Richtungen der islamischen Koranauslegung* (Leyden 1920). The first is a condensed monograph recounting the evolution of an extinct Sunnite juridical school. The *Muhammedanische Studien* inaugurated the use of methodical historical criticism in Islamic studies to explain the many survivals of Bedouin tribal life in the structure of the Mussulman community and the growth of the "tradition," that fundamental juridical source containing the

sayings attributed to the Prophet. The *Vorlesungen* is a scholarly manual containing a summary of various aspects of Islamic civilization and the *Richtungen* an exposition of the different schools of Koranic exegesis. Goldziher accumulated and condensed an exceptional amount of new information, drawn chiefly from manuscript sources, and made it easily available through his capacity for exposition: he was more a historian than a philologist. He laid the basis for an appraisal of the *Hadith* (canonical collections), showing that much of it had been fabricated by theological politicians after Mohammed's death, and indicated its influence upon the collective religious consciousness. His counsels have guided subsequent research not only in the history of Arabic grammar but also in that of the formation of sects; in the foreign influences on Islam, such as the gnostic, Christian and neo-Platonic; and in the organization of workmen and trades.

GOLTZ, THEODOR VON DER (1836-1905), German agricultural economist. Goltz at first studied law but turned his attention to the study of agriculture. He taught at several agricultural colleges in Germany and from 1896 until his death was director of the agricultural college at Poppelsdorf (Bonn)—the school in which he had obtained his professional training. At a time when the study of agriculture was dominated by the natural sciences under the influence of Liebig and preoccupied with technological problems Goltz emphasized the business aspect of agriculture. He held that the ultimate goal is not the gross yield but the net profit. In order to increase the remunerativeness of agriculture he advocated the combination of the small and middle sized peasant holdings for the purpose of cooperative cultivation of the soil and common use of tools, machinery and draft animals. Such combination would secure to the smaller enterprises the benefits of large scale production and management and assure the survival of the peasant class—an important element in the population of a country. In contrast to modern tendencies Goltz would not have the cooperative system extended to large capitalistic enterprises. He contributed greatly to the reform of rural

education on the basis of the actual needs of the rural population. He also recognized the necessity of cooperation and understanding between laborer and landlord and consistently urged upon the latter the need of raising the cultural level of the laborer, improving rural education and ameliorating rural housing. His treatises repeatedly stressed the mutual interdependence of all classes in their pursuit of social welfare.

GOMEL, CHARLES (1843-1921), French economist. Gomel was member of the state council from 1872 to 1886, resigning at the time when the decrees were issued ordering the expulsion of the house of Orléans from France. He soon joined the administration of the Compagnie des Chemins de Fer de l'Est, of which he became president, retaining the post until his death. He was well versed in all problems pertaining to the administration of railroads and contributed many authoritative studies on this subject to the *Économiste français* in the period from 1886 to 1906. He successfully disproved the unjust criticism leveled against the conventions of 1883, which represent one of the most important agreements regulating the relations of the state to the railroads. Gomel was also interested in foreign railroads, in the working of mines, particularly coal mines, in public works and in other fields of economic activity. Of no less significance are his writings on the financial causes of the French Revolution; they deal in a most elucidating manner with the administrations of Turgot and Necker and the last of the controllers general and with the financial history of the Constituent Assembly, the Legislative Assembly and the Convention.

GOMME, SIR GEORGE LAURENCE (1853-1916), English anthropologist and historian. Gomme was the most active cofounder of the English Folklore Society, parent of all similar movements throughout the world, although it was W. J. Thoms who had coined the word folklore itself in 1846. Moreover, Gomme did most to give the new science its orientation by insisting on the study of customs in their historical setting: "custom, rite and belief . . . become veritable monuments of history—a history too ancient to have been recorded in script, too much an essential part of the folk-life to have been lost to tradition" (*Folklore as an Historical Science*, London 1908, p. 170). The theoretical justification of this ethnological line of research is also stated in his *Ethnology in Folklore* (London 1892). Those were the days of E. B. Tylor's influence, when psychological interpretations prevailed and interest was therefore mainly directed toward beliefs. Gomme did his best to call attention rather to social institutions, especially as viewed in the light of the movements and clashings of peoples out of which they arose. These working principles are well illustrated in his masterly study of the British village community (*The Village Community*, London 1890), which he treats as a result of culture contact between Aryan and pre-Aryan folk elements. Gomme was also an efficient public servant on the London County Council from 1900 to 1916 as well as an authority on the history and antiquities of London (see *The Governance of London*, London 1907; and *London*, London 1914). He is to be regarded as a pioneer who, while avoiding the extravagances of a one-sided diffusionism, nevertheless made it clear that for a comprehensive study of culture originating and borrowing must count as the warp and woof of human progress.

R. R. MARETT

GOMPERS, SAMUEL (1850-1924), American labor leader. Gompers was born of Jewish parents in the East End of London and after four years' schooling was apprenticed to cigar making, his father's trade, which he followed for twenty-six years. In 1863 the family emigrated to New York's East Side with no marked improvement in well-being. Driven by a consuming energy and unbounded ambition Gompers threw himself into every activity that might

lead an East Side immigrant boy out of the alienism of his environment into the full stream of American life. In social clubs, fraternal orders, saloon gatherings, cigar shops and trade unions he sought and found a hard, practical wisdom and facility in handling men as individuals and en masse.

Gompers joined his local trade union (no. 15) in 1864, and ten years later he and his Left wing friends broke it up to create local 144, of which he was president until 1881 and a member for the rest of his life. In 1877 he was instrumental in making Adolph Strasser president of the nearly defunct Cigar Makers' International Union and proceeded to reorganize it as a benefit society on the English model. When in 1881 a new Left wing ousted Gompers from the presidency of his local, he turned to the national field and gained control of the newly formed Federation of Trades and Labor Unions. Gompers' passionate distrust of socialists and intellectuals, particularly those of continental European stamp, grew out of his experience with the cosmopolitan radicalism of New York in the seventies and made him increasingly American and trade unionist.

In 1886 he was able to mobilize the trade unions against the Knights of Labor and became first president of the American Federation of Labor, a post he retained with the exception of one term (1895) until his death. For nine years this militant labor general fought a successful rear guard action against all comers with a loosely federated group of touchy national unions. He avoided the stigma of the Hay-market bomb, the effect of socialist propaganda and intrigue, the failure of the American Railway Union, free silver sentiment and a prolonged depression. His defeat in 1895 gave him a trip to Europe, which completed his education in Americanism. He returned with reviving prosperity, was reelected president of the Federation and moved his headquarters to Washington.

In Washington Gompers found himself in a completely congenial environment, and although he preached more loudly than ever his doctrine of voluntary trade unionism unhampered by government he became increasingly involved in lobbying for labor's measures and patronage. In 1906 the American Federation of Labor openly adopted a non-partisan political program, and from 1908 to 1920 it supported the Democratic party, securing the passage of the Clayton, the seamen's and the Adamson acts

The election of Woodrow Wilson gave labor for the first time in American history a place among the mighty, and during the World War Gompers was made a member of the Advisory Commission to the Council of National Defense. Convinced of his messianic mission, he created the Alliance for Labor and Democracy to promote loyalty. He toured Europe in 1918, meeting kings, presidents, generals, but encountering a recalcitrant proletariat.

In the period of post-war reaction he was denied a place on the Peace Commission but was made chairman of the Commission on International Labor Legislation, which drew up what, with some modification, became the labor covenant of the Treaty of Versailles. After failure to control the Amsterdam International he came back to the United States to face schism and defeat. Strikes of the steelworkers, of the Boston police, of the miners and of the shopmen; the failure of the president's industrial conferences; the activities of the Communists; the Plumb plan; the defeat of the Covenant of the League of Nations, of the Democratic party and almost of Gompers himself for the presidency of the Federation left the old man, then nearly blind, sick indeed.

But in the end Gompers found complete, if illusory, satisfaction. He had been the friend of Mexico when its friends were few. Turning from European failure and confusion at home he sought Pan-American unity. He restated in labor terms the Monroe Doctrine. In 1924 Mexican and American labor met at the international boundary. At the inauguration of Calles in Mexico City Samuel Gompers divided with the new president the adulation of the Mexican proletariat, expressed with the Latin exuberance and éclat which touched the emotional and theatrical side of his character as practical labor politics had never done. He died shortly after the conference in San Antonio, Texas.

Consult: Gompers, Samuel, *Seventy Years of Life and Labor*, 2 vols. (New York 1925); Reed, Louis, *The Labor Philosophy of Samuel Gompers*, Columbia University, Studies in History, Economics and Public Law, no. 327 (New York 1930), which contains an extensive bibliography of writings by and about Gompers.

GONNER, SIR EDWARD CARTER KERSEY (1862-1922), English economist. From 1891 until his death Gonner, an Oxford graduate, held the Brunner chair of economic science at the University of Liverpool. Writing in the

period before specialization, he made fruitful contributions to many difficult aspects of the science. His edition of Ricardo's *Principles* (London 1891), his textbook, *Commercial Geography* (London 1894), and his survey of the modern economic development of Germany in *Germany in the Nineteenth Century* (ed. by C. H. Herford, Manchester 1912; 3rd ed. 1915) display uniform competence. Among his other minor writings were *The Socialist State* (London 1895), a designedly sympathetic yet warily discriminating account, and *Interest and Saving* (London 1906), which shows the penetrating quality of Gonner's mind occasionally leading him into somewhat subtle and elusive argument but nevertheless well matched against the complex subject in hand. His two most considerable works, *The Social Philosophy of Rodbertus* (London 1899) and *Common Land and Inclosure* (London 1912), were preceded by an enormous amount of research. Treating the movement as "continuous and as due in the main to the operation of large economic and, so to say, normal causes," buttressed by statistics, pleading no cause, *Common Land and Inclosure* will undoubtedly remain the final verdict when other more partial pronouncements on the vexed subject have been set aside as suspect. The fine balance and insight which directed Gonner's exact and patient inquiry in this enduring contribution to economic history also made him a talented man of affairs. During the World War, when he was economic adviser and director of statistics in the Ministry of Food as well as an arbitrator of industrial disputes, he won the confidence and esteem of his chief, Lord Rhondda. In the words of an experienced colleague, Sir William Beveridge, "he was one of the men of academic training who most conspicuously made good in practical administration during the War." When he died he was collaborating in the preparation of a history of food control.

GONZÁLEZ DE CELLORIGO, MARTÍN, Spanish economist of the late sixteenth century. González was the author of several memorials addressed to Philip III, *Memoriales* (Valladolid 1600), in which he presented interesting and novel economic theories. In the first, "De la política necesaria y útil restauración a la república de España," González frequently cited Bodin's *Republic*, which undoubtedly inspired his

surprisingly modern doctrines of work and wealth. Natural laws, he asserted, teach man to work; hence work is the "true and certain wealth" of nations. Considering money but an "instrument of exchange" he argued that an increase in its volume, representing no increase in wealth, might hamper commercial intercourse. False ideas of the wealth of the Indies had led to an abandonment of agriculture and industry; and idleness and the consequent dearth of goods had brought on epidemics, which had depleted the population more than war or emigration. This view of Spain's economic decay led González to the conclusion, astonishing for his time, that Spain would have been more wealthy if no treasure had come from America. His most prominent proposal for reform was the abolition of leisure, and he prescribed for the nobility business pursuits in conformity with their rank. He decried excessive poverty and wealth and was opposed to the egalitarian ideas of More's *Utopia*; in his ideal society the middle class was to be the most numerous. Sections of Augustín de Rojas Villandrando's *El buen repúblico* (Salamanca 1611), dealing with economic doctrines, are taken verbatim from González's *Memoriales* without acknowledgment.

The second and third memorials were entitled "Sobre los moriscos" and dealt with the problem of the Moors. Since the converted Moors were notoriously industrious, González pleaded for their better education in Christian virtues, so that no occasion might arise for expelling them upon religious grounds.

ROBERT S. SMITH

GOOD OFFICES. *See* **MEDIATION.**

GOOD ROADS MOVEMENT. *See* **ROADS.**

GOODWILL originally meant that part of the value of an established business which was attributable to the continued patronage of its customers. This meaning has since been extended. Economists continue to adhere essentially to the original concept of goodwill as a relation between the business and the market. But while they still consider the goodwill of the consumer as by far the most important type they recognize also the existence of goodwill in the labor market, the credit market and elsewhere. Jurists and accountants, on the other hand, have broadened the meaning of the term to include all the advantages which a particular business possesses over its competitors. The jurist's approach to good-

will remains fundamentally different from that of the economist. The economist tends to conceive it as emanating from its source. The jurist, because of the necessities of legal transfer, tends to think of it as attaching to the business and as a species of property despite the fact that ordinarily goodwill cannot be conveyed apart from the business.

In England the term goodwill seems to have been used first in 1571, when a testator willed the goodwill of his quarry as part of his possessions. In the case of *Broad v. Jollyfe* [Cro. Jac. 596 (1620)] the purchaser of the wares of an old shop was awarded judgment against the vendor for violation of an agreement not to keep a shop in that vicinity. For the first time the courts thus recognized the validity of contracts which limited the freedom of the vendor to compete, and which had previously been considered as in restraint of trade. In *Crutwell v. Lye* [17 Ves. 335 (1810)] Lord Eldon, who was important in the development of the law of goodwill in England, described it as "the probability that old customers will resort to the old place." It thus became something essentially connected with convenient location. American and British courts still recognize the importance of goodwill in raising the value of the sites on which successful businesses are located. In England goodwill is utilized by officials as an aid in measuring rent for tax purposes. Furthermore, by the Landlord and Tenant Act of 1927 the tenant who has been located in one place for at least five years is given a right to compensation for the loss of the goodwill attached to the place or, if compensation would be inadequate, a right to a new lease. In the United States goodwill is not held to be property within the meaning of the constitutional limitations on the taking of property.

The early emphasis upon location was due to the fact that the concept of goodwill was first applied to small scale businesses treating with the consumer directly and personally. The elements first added to the concept—firm name, trademarks, personal qualities—were also applicable to the type of business concerned. With changes in the economic structure and the broadening of the goodwill concept other factors have entered and have become perhaps more important than those earlier associated with the term. Thus location has ceased to play its former predominant role and personal qualities are almost meaningless in an impersonal economic organization. The length of time in business, so important in the establishment of custom in the

earlier economy, has become less important in the development of goodwill than high pressure salesmanship and advertising. These methods of attracting custom attempt to and do create goodwill in a relatively short period of time. With the concentration of industry mere size or quasi-monopolistic position in the industry has become an element in goodwill through the common belief that size guarantees quality, cheapness, reliability, service and the other desiderata which determine the purchaser's choice in the competitive system.

The basic element in goodwill is the tendency, in a competitive situation in which many choices are possible, for a particular business to be chosen a large number of times. It is not sufficient that this choice shall be due to lower prices or better quality relative to price; there must exist some tendency in the business to attract consumers, laborers and capitalists out of proportion to the price it charges, the wages it pays or the interest and security it offers. Goodwill is a quasi-monopolistic factor in a competitive society, a factor which "lifts the business somewhat above the daily menace of competition and enables it to thrive without cutting prices" (Commons, J. R., *Industrial Goodwill*, ch. iii).

It is reflected in higher prices or larger sales, either of which means larger profits than those normally received by competitors. While courts have occasionally held that goodwill may exist even if no net profits are earned, the general rule is that the existence of goodwill can be predicated only upon earnings in excess of the normal competitive return. Economists distinguish the excess profits resulting from internal economies from those resulting from the exploitation of the quasi-monopolistic position achieved by the company by virtue of its goodwill. Because, however, of the practical impossibility of segregating profits arising from efficiency from those resulting from goodwill in the narrow sense of the term jurists and accountants, faced with the practical problem of evaluating goodwill, have tended to attribute all excess earnings to goodwill.

The value of goodwill is therefore generally arrived at by capitalization either of total net earnings or of earnings above the normal. The normal return, including both interest and profit, upon the total cost of the tangible assets of an industry is about 10 percent (Simpson, K., *Economics for the Accountant*, New York 1921, ch. xi). All return above this amount may be considered extra profits attributable to goodwill.

The number of years' purchase of the profits to be used in capitalization is essentially a matter of fact to be determined for each particular business. Courts, however, rarely allow valuations involving more than five years' purchase. The British law of partnership capitalizes goodwill at two years' purchase of total profits.

Goodwill represents an asset only because of the probability of earning excess profits in the future. General accounting practise is therefore against its inclusion as an asset unless it has been purchased. If an established company shows an abnormally large return, there can be no objection to the capitalization of goodwill as an asset on the balance sheet so long as the return is thereby not reduced below the normal and so long as stockholders, actual and potential, realize what is back of the stock. Since earnings rather than assets are the chief criterion of market value, investors may be justified in buying this so-called water.

A considerable number of industrial corporations and partnerships with valuable trade names have sold their assets to new corporations in return for preferred and common stock of the new companies. The F. W. Woolworth Company, the S. S. Kresge Company and the B. F. Goodrich Rubber Company are examples. The preferred stock of these companies was generally equal to the original cost of the tangible assets. This stock was usually sold to the public, while the common stock, covered for the most part by goodwill justified by earning power, was presumably retained by those responsible for the development of the business. These flotations enabled the original owners to draw out their original investment through the sale of the preferred stock and to capitalize their goodwill in the form of common stock. The total capitalization of a merger often exceeds the combined capitalization of the old companies, the difference representing the goodwill or the capitalization of the prospective excess earnings.

Considerable disagreement exists as to whether goodwill once purchased and entered on the book should be written off with the passage of time. An English court has held that such depreciation is not necessary [*Wilmer v. McNamara & Co., Ltd.*, 2 Ch. 245 (1895)]. Furthermore, obvious difficulties in the way of writing off goodwill arise where stock is issued against the goodwill. A considerable body of opinion, however, inclines to the view that since it is of an impermanent, evanescent character, requiring constant care for its maintenance, it should be

written off in the period of time used as the basis for calculating its value.

Because goodwill was originally assumed to depend upon freedom of choice, the courts have consistently refused to allow monopolistic public utilities to include it in valuation for purposes of rate regulation. Nevertheless where the "going-concern value" is admitted as an element in utility valuation, goodwill comparable to that in competitive businesses is allowed for. The dependence of the sale value of goodwill upon its transferability has led Anglo-American courts generally to limit closely or disallow goodwill as an independently calculable or realizable asset in professions or businesses dependent upon the personality of the individual. That these may possess a goodwill based not alone on skill and ability would seem evident. But despite the fact that only to a very limited extent, varying with the profession and circumstances involved, can the owner transfer the confidence of his clients, patients or patrons to his successor, English and American courts since the time of Lord Eldon have put no obstacles in the way of sales of practise. Such sales are construed as giving an exclusive right of presentation and as compelling the retirement of the vendor from the neighborhood. The goodwill of a newspaper might also seem to be difficult to transfer, but large payments have occasionally been made for it, as in the case of the purchase of the *New York World* by the *New York Telegram* in 1931. The goodwill of capitalists and of those from whom the business buys is hardly transferable. That of labor, however, may be fairly successfully transferred, especially where change of ownership does not involve change of the personnel treating directly with labor. The employees may not even know that the ownership has changed.

Goodwill as regards particular products may attach to particular locations, as in such expressions as Sheffield cutlery and Paisley shawls, or even to certain countries, as in the case of German optical goods and English woollens. But these types of location value are common to all businesses in the country or district concerned. Location value becomes important for a particular business only when and in so far as it increases the profits of that particular business.

Recognition of goodwill as a transferable asset involved protection of the rights of the purchaser. Court decisions early recognized the legality of the vendor's agreement not to compete, although the courts have tended to invalidate agreements involving unreasonable conditions.

holding these to be in restraint of trade. The general rule in England and the United States (except in Massachusetts) is that in the absence of a specific agreement to the contrary the vendor may open a business and compete with the purchaser. American law generally restricts such competition only by requiring that it be fair and free from fraud, but in England and in the state of New York while the vendor may advertise publicly he may not solicit his former customers directly. In case of violation the purchaser may obtain an injunction restraining further interference by the seller.

The legal treatment of goodwill in continental countries bears a strong resemblance to that in English and American law. The continental law too is mostly case law, engrafted upon the codes. In the Latin countries two terms are employed to express goodwill; in France, for example, *clientèle* and *achalandage*—the first representing the personal goodwill of the customers and the second the impersonal goodwill resulting from the connections of a business. Agreements for the transfer of goodwill are everywhere held not to be in restraint of trade. While under German law the mere sale of a business does not, in the absence of special circumstances, restrict the seller from further competition, in France the *obligation de garantie* which is implied in the sale of a business has been held to forbid the seller from any diminution or withdrawal of the goodwill. The French courts have been much more liberal than the German in sanctioning the transfer of goodwill in the sale of professional practises. The German courts before the war uniformly condemned the transfer of lawyers' and very often of doctors' practises. Such transfers were not only not recognized by the courts but were condemned by professional ethics. From a much earlier period, however, the French courts had withdrawn their opposition to the sale of professional practise. The transfer of the goodwill of all sorts of professional practises and commercial agencies has long been very common in France. Even a notary's practise may be transferred in France despite the fact that he is an official and his service is not subject to real competition, because of the limitation of the number of notaries. The consent of the government must be obtained but it is granted practically as a matter of course. In czarist Russia, where the number of apothecaries was also legally limited, the sale of their goodwill was similarly allowed. Such transfers are really survivals of the once common buying and selling of offices.

The French legal treatment of goodwill is far more advanced than the German. Under the law of 1909 relating to *fonds de commerce* it is possible to mortgage a business itself, and in the absence of express stipulation the pledge is limited to "l'enseigne et le nom commercial, le droit au bail, la clientèle et achalandage"—in other words, to the intangible assets, of which the goodwill is regarded as the most important. The debtor may be threatened with foreclosure if he manages the business badly or injures his credit or goodwill, and he may not change the place of business without good cause. Such a mortgage is impossible under German law and for that matter under Anglo-American law.

The law of goodwill is conventionally considered only in connection with the transfer of specific businesses or professional practises. As a result, the general protection afforded to goodwill by many provisions of law is often forgotten. Goodwill along with other forms of intangible assets is preserved by the whole law of unfair competition (*q.v.*), which in recent decades has undergone a tremendous expansion. Other legal devices which aid in protecting goodwill include actions of libel or slander, criminal statutes against endangering the credit of a business and laws against the enticement of employees and against picketing and boycotting.

GOOS, CARL (1835-1917), Danish jurist and political figure. Goos was professor at the University of Copenhagen and occupied at various times the posts of director of prisons, minister of education and minister of justice. The influence exerted on Goos by his teacher and predecessor, F. C. Bornemann, a devotee of Hegel, was later counterbalanced by his study of English thinkers, especially John Stuart Mill. One of his principal works, the *Forelaesninger over den almindelige retslaere* (2 vols., Copenhagen 1885-92), presenting an exposition of a general theory of law, is equally remote from Hegelian dialectic and any logical deduction from abstract ideas; it rests rather upon a solid foundation of knowledge of human institutions, and the legal analysis contained in it became of fundamental importance to Goos' treatment of positive law. Thus in the law of contracts he started from the principle of good faith as its primary element, in contradistinction to the Roman law doctrine of consent. Again, where the nature of an illegal act was to be determined, he emphasized the necessity of objective limits ruling out all metaphysical or subjective decisions. Remarkable powers of exegesis, precise definition and the capacity for systematization stamp Goos' other principal work, *Den danske strafferet* (5 vols., Copenhagen 1875-96), an analysis of Danish criminal law. Fundamentally Goos' criminological views were closely akin to those of the classical school. Originally he regarded punishment as directed toward disciplining the will of the delinquent to law obedience, but later he combined with this view the principle of retribution. This change was caused in part by his reaction to indeterminate sentences, which he held would jeopardize the rights of the individual in his dealings with the community. Goos' exposition of particular crimes in the special part of this treatise is hardly rivaled by any other book in European literature. In the sphere of legislation too Goos did splendid work, particularly in the fields of procedure and criminal law. Moreover, he was looked upon everywhere as an authority not only on penology but also on international law. Preeminent among Danish jurists, Goos holds a central position as a thinker of genius who bridged the gap between the realism of Oersted and the speculation of Borne-

mann. The whole succeeding generation of jurists has been more or less consciously influenced by him.

FRANTZ DAHL

Consult: Hagerup, F., Dahl, Frantz, and Thyren, J. C. W., in *Nordisk tidsskrift for strafferet*, vol. iii (1915) 1-55; Dahl, Frantz, in his *Juridiske profiler* (Copenhagen 1920) p. 11-59, and bibliography in *Ugeskrift for retsvaesen* (1915) 24-32; Teisen, Axel, in *American Law Review*, vol. i (1916) 262-68.

GORDON, AARON DAVID (1856-1922), Jewish social philosopher. At the age of forty-eight Gordon left Russia, where he had been employed as a bookkeeper and minor estate official, to become an agricultural worker in Palestine and later a member of the communal settlement, Daganian.

Through his many writings, which were posthumously collected into five volumes (*Kitve*, Tel Aviv 1925-29), Gordon made two outstanding contributions to the philosophy of Jewish life in Palestine: his concept of the creative basis of agricultural work and his theory of Jewish nationalism. In these beliefs, which were based on libertarian individualism and religious idealism, Gordon showed the influence of Tolstoy. He believed in self-perfection, which for him meant self-expression by work in harmony with the laws of nature. He rejected every difference between individual and national ethics. In one of his treatises he stressed the power of suggestion exercised by force, might and wealth and held that it lay not in the virtue or greatness of the ruling classes but in the longing for power in the souls of the governed. Gordon insisted upon the duty of the individual to free himself from mass suggestion and to develop his independent critical reflection. The nationalism which evolved out of this basis was of a peculiar type. For Gordon the Jews were not and could never become a nation like other nations: the rebirth of Judaism meant not a political or an economic but a spiritual and moral regeneration based on the ideals of the prophets. As the Jews had once proclaimed that man was created in the image of God, they must now strive to lead and to realize a race or nation created in the same image. During the World War Gordon, almost alone among Palestine Jews, was actively opposed to the creation of a Jewish Legion but his doctrines of nationalism remained without any considerable influence.

His emphasis on the creative value of agricultural work, especially for the Jewish people which had so long been divorced from "pro-

ductive" labor, made him the spiritual father of the Cholutz, or pioneer, movement, and despite his opposition to socialism because of its roots in rationalism and mechanism he was considered one of the leaders of the Jewish labor movement in Palestine.

HANS KOHN

Consult: Selected essays from Gordon's collected works have been translated into German by V. Kellner as *Erlösung durch Arbeit* (Berlin 1929), with a biography; Kohn, Hans, *L'humanisme juif* (Paris 1931); Spiegel, Shalom, *Hebrew Reborn* (New York 1930) p. 409-17, 467-68; Aaronovitch, J., and Dayan, S., *A. D. Gordon*, Young Jew series, no. 3 (New York 1930).

GORING, CHARLES BUCKMAN (1870-1919), English psychiatrist and criminologist. After medical studies in London and Paris, Goring was in 1903 appointed deputy medical officer of the Parkhurst Prison, where his predecessor, Dr. Griffiths, had already begun an anthropometric investigation designed to test Lombroso's theory of an anthropological criminal type. Assisted by medical officers of other prisons Goring enlarged and concluded this investigation. The result was a report on *The English Convict: a Statistical Study* (London 1913; abridged, 1915) which has as yet no equal in the field of statistical criminological research. The report was based on biological and social data gathered from a random sample of 3000 male convicts. In the process of analysis various groups of prisoners were compared with each other and with the prison and the general population of the country; and all or significant portions of data concerning them were correlated with similar data personally gathered or found in contemporary studies made by other scholars on Cambridge, Oxford and Aberdeen undergraduates, Scottish criminals and insane, New South Wales criminals, hospital inmates and certain army units.

Assuming that there exists in all persons a constitutional proclivity toward crime, which he called criminal diathesis, Goring proceeded to uncover the associations of this factor with the environment, training, biological stock and physical attributes of prisoners. His anthropometric data caused him to deny the existence of a criminal type in the Lombrosian sense. He found, however, that those imprisoned for crimes of violence had on the average a finer physique and greater constitutional soundness than other prisoners or the general population and showed a greater incidence of suicidal or insane tend-

encies, ungovernable temper and obstinacy of purpose; and that burglars and thieves, who comprised 90 percent of the prisoners studied, were on the average inferior in stature and weight to other prisoners and to the general population. The defective intelligence of offenders against property was also pronounced. He was forced to the conclusion that defective physique and intelligence are the two significant factors associated with criminality.

Rarely has such a challenging work as Goring's been received with such acclamation. The opponents of Lombroso saw in it the death knell of the theory of an anthropological criminal type. The disciples of the Italian criminologist regarded it as a complete vindication of their master.

GOROSTIAGA, JOSÉ BENJAMÍN (1822-91), Argentine statesman. Gorostiaga was a delegate to the Constitutional Assembly at Santa Fé in 1853 and subsequently became minister of the interior under General Justo José de Urquiza, the first constitutional president of Argentina. He was a national deputy, and vice president of the Chamber in 1862. In 1877 he was appointed president of the Supreme Court, an office which he held for ten years.

Gorostiaga was the central figure of the Constituent Assembly and one of the chief authors of the Argentine constitution. As a jurist he was superior to Alberdi, whose plan of a constitution, published in 1852, contained many defects. Gorostiaga reported the progress of the project to the Assembly and in the debates proved his thorough knowledge of public law. The main body of the constitution, with the exception of the general sections, was edited by Gorostiaga. In its final form it showed the influence of the Constitution of the United States, adapted, however, to the exigencies of Argentine national experience.

JUAN A. GONZÁLEZ CALDERÓN

GÖRRES, JOSEPH VON (1776-1848), German publicist. Görres was born in Coblenz and in his youth came under the influence of the rationalist cosmopolitan thought of the Enlightenment. He was an enthusiastic supporter of the French Revolution, violently anticlerical and for a time an advocate of the creation of a free Rhenish republic after the French model. Toward the turn of the century he became disillusioned concerning the prospects of the salvation of humanity through French influence. His association with the Heidelberg romanticists during the period between 1802 and 1805 and more especially his preoccupation with the works of Herder aroused in him a deeper sympathy for the Middle Ages, for traditionalism and for national individuality.

In January, 1814, Görres assumed the direction of the *Rheinischer Merkur*, the first important newspaper in the history of German journalism. This paper became the focal point for the German national movement and the most violent literary opponent of the French. Görres followed the German troops in the Rhineland, inflamed them with German patriotism and proclaimed the Rhineland as German territory from time immemorial. The most important German literary figures like Arndt, Kleist and the brothers Grimm contributed to this paper; it was used by Baron vom Stein as his mouthpiece, was read and translated in England and in France and was so influential as to be termed by Napoleon *la cinquième puissance*. During the course of the peace negotiations Görres pressed for the solution of the German national problem. He advocated the restoration of the old mediaeval empire with Prussia and Austria as the leading states of northern and southern Germany respectively. His opposition to the Prussian aims at hegemony as well as his protests against the policy of reaction brought about the suppression of his newspaper on January 10, 1816. For similar reasons his pamphlet *Deutschland und die Revolution* (Coblenz 1819) was confiscated by the Prussian government and Görres was forced to flee to Strasbourg.

Görres subsequent career is marked by his closer affiliation with the Catholic church. With his growing interest in the Middle Ages had come also an increased appreciation of religion in general and the mediaeval church in particular. Called in 1827 to Munich as professor of history, he became the center of a circle of Catholic intellectuals and politicians which marked the beginnings of organized Catholic political

action in Germany. His pamphlet, *Athanasius* (1837), was the great trumpet call for the political equality of the Catholics and for the freedom of the Catholic church. The *Historische politische Blätter für das katholische Deutschland*, founded in 1838 at the instigation of Görres, was both before and after his death the most important organ of Catholic public opinion.

Görres was not an original thinker. His theory of nationalism was but an elaboration of Herder's and his organismic, hierarchical, authoritarian and anti-absolutist theory of the state was in all essentials identical with that of all the other leading conservatives of the period of reaction. But Görres clothed all these ideas with a concrete and symbolical expression, infused into them such a spirit of moralism and earnestness and pursued them with such unbounded energy and ardor that he may justly be called the greatest of German publicists.

KOPPEL S. PINSON

Works: *Gesammelte Schriften*, ed. by Wilhelm Schellberg and others, vols. i-ii, vi-xiii (Cologne 1928-29); *Gesammelte Schriften*, ed. by Marie Görres, 9 vols. (Munich 1856-74).

Consult: Schellberg, W., *Joseph von Görres* (Gladbach 1922), and his introduction to Görres' *Ausgewählte Werke und Briefe*, 2 vols. (Munich 1911); Galland, Joseph, *Joseph von Görres* (2nd ed. Freiburg i.Br. 1876); *Görres Festschrift*, ed. by Karl Hoeber (Cologne 1926); Borinski, F., *Joseph Görres und die deutsche Parteibildung*, *Leipziger rechtswissenschaftliche Studien*, no. 30 (Leipzig 1927); Berger, M., *Görres als politischer Publizist* (Bonn 1921).

GORTER, HERMAN (1864-1927), Dutch socialist. After taking his doctorate in classics at the University of Amsterdam and publishing a lyrical poem, *Mei* (Amsterdam 1889, 3rd ed. 1900), which placed him among the foremost of modern poets, Gorter became interested in philosophy, translated Spinoza's *Ethica* and then studied the works of Marx. He wrote several works popularizing Marxian doctrines, showing a remarkable ability to present abstract material lucidly. Gorter also made several able and original applications of the methods of historical materialism to art and poetry. In 1897 he joined the Sociaal-Democratische Arbeiderspartij and became an indefatigable propagandist of militant socialism. As one of the staff of the Marxian monthly, *De nieuwe tijd* (The new times), he fought against the opportunism of the party leaders. In 1909 after the expulsion from the party of the radical group prominently identified with the weekly *Tribune* he became associated with them in establishing the Sociaal-

Demokratische Partij. Shortly after the outbreak of the World War he wrote a brilliant pamphlet denouncing imperialism and the socialists who supported the war and arguing that the working class had no reason to wish for the triumph of any of the belligerent powers. Gorter hailed the Russian Revolution of October with boundless enthusiasm and helped found the Kommunistische Partij in the Netherlands in 1918. He soon diverged, toward the left, from the views of the Communist International. He helped draw up the program of the Kommunistische Arbeiterpartei in Germany and in 1920 replied to Lenin's pamphlet *Radicalism, the Infantile Disease of Communism* in an open letter in which he differentiated between the tactics successful in Russia and those advisable in western Europe and attacked the policy of Communist participation in parliamentary activity. In the fall of 1921 he founded the Kommunistische Arbeiderspartij and in 1922 retired from politics. In 1917 he published *Pan*, a poem of the proletarian world revolution and a glorification of dialectical materialism.

GOSCHEN, FIRST VISCOUNT, GEORGE JOACHIM GOSCHEN (1831-1907), British statesman and financier. He was of German extraction. After taking a classical course at Oxford he entered his father's firm of merchant bankers in London. He soon turned to politics, entering Parliament in 1863 and being given cabinet rank in 1866. As a politician he was chiefly known for his consolidation and simplification of local government loans and taxes and for his conversion of the 3 percent national debt (consols) into securities bearing $2\frac{3}{4}$ percent for fifteen years and thereafter $2\frac{1}{2}$ percent—an operation which meant a large saving for the government but which was held to have weakened the state's power to borrow except on a basis of par redemption at a fixed date.

Goschen did not profess to be an economist but he wrote a number of illuminating studies

on monetary subjects, some of which were regarded by bimetallists as supporting their doctrines, and on the incidence of local rates in England. His *Theory of the Foreign Exchanges* was the first systematic theoretical account of the mechanism whereby international price adjustments are brought about. Although not free from inconsistencies it was yet a lucid presentation of the view that a country's foreign exchanges are regulated as much by the amount of its short term indebtedness as by the quantity of its monetary stock and the internal price level. It was rapidly recognized as a standard work throughout the world. Criticism of it has been directed chiefly against the doctrine that the adjustment of the foreign exchange position is automatic and that the central bank in altering its discount rate is following rather than controlling market conditions. The desire to emphasize this point of view sprang from Goschen's distrust of authoritarian interference with the "natural" workings of the price system. As chancellor of the Exchequer at the time of the Baring crisis in 1890 he was adamant in refusing government assistance to prevent a credit collapse. A convinced free trader, he was opposed to Joseph Chamberlain's policy of tariff reform. He also took a leading part in the movement for abolishing religious tests in the older universities. In other spheres, however, he was less radically individualist. In 1884 he fought Gladstone's franchise bill on the ground that complete democracy meant the dictatorship of the lowest classes. Two years later his hostility to Irish home rule made him one of the leaders of the Liberal Unionists and soon brought him into the Conservative party, where he ended his governmental career.

GOSPLAN is the abbreviated name of the Gosudarstvennaya Planovaya Kommissiya pri STO. or the State Planning Commission of the Coun-

cil of Labor and Defense, which was instituted by decree of the Russian Soviet government (the Council of People's Commissars of the R. S. F. S. R.) on February 24, 1921. Its parent body, the STO, or the Council of Labor and Defense, composed of leading members of the government, is the supreme economic general staff, exercising a coordinating control even over the work of people's commissariats, or ministries, and possessing within limits certain legislative powers of its own. The Gosplan is an advisory commission of experts, subordinated to the STO, whose function is the drafting of plans for the future economic development of the Soviet Union along socialist lines.

It is no part of Communist theory that a planned economy can be developed over night or that a Five-Year Plan can appear upon the scene as a *deus ex machina*. According to Communist theory the political prerequisite, the transfer of power from the propertied class to the working class, is an act of revolution supplanting the previous capitalist state by one of a historically new type, a workers' state, which is the concrete form of what Marx called the dictatorship of the proletariat. And just as this political revolution marks a stage in the historical process, so the subsequent building of socialism, the economic revolution, must be conceived as a part of that developing process. Lenin did not attempt to introduce complete communism at one fell swoop on the morrow of the revolution of November, 1917; and a five-year plan, although much talked of in earlier years, was introduced only in 1928 after the ground had been prepared by the economic policy of the preceding eight years.

The economic policy of these years falls into three clearly marked periods. The first period, which embraces the eight months preceding the outbreak of civil war in July, 1918, was the period of the first crude attempts at building a new apparatus of economic administration, of cautious and on the whole experimental nationalization. For the time being only key enterprises were nationalized and the state confined itself to such measures of general economic control as were witnessed in all belligerent countries during the war. At the same time considerable powers of control over the actions of private owners were delegated to workers' committees in each enterprise (see BOLSHEVISM).

This first period was sharply broken by the advance of the White armies from the Urals and from the Caucasus. The economic system was

subordinated to immediate military ends, and the control of industry was hurriedly centralized under an improvised semimilitary machine. Since the civil war was essentially a class war, the administration of industry could hardly rest on the basis of cooperation with private capitalists. Hence that improvised system of centralized control, which in capitalist countries during the war was termed war socialism, in Russia necessarily took the much more drastic form of war communism. Industry was hastily nationalized in a more sweeping manner than would have otherwise been contemplated, and its administration was directly subordinated to industrial departments (*glavki*) organized as sections of the Supreme Council of National Economy (*Vesenha*). A special Commissariat of Supply (*Narcomprod*) was set up to organize the distribution of primary products and of finished commodities, and distributive organizations such as the cooperatives were progressively subordinated to its control. A rationing system of supplies quickly replaced ordinary retail trade and the open market, and to insure food for the towns and the army a system of requisitioning was applied to the peasants' grain surplus in the villages. Collection of foodstuffs and raw materials and the distribution of finished industrial products assumed the form of a giant system of centralized state barter. Relentless struggle against the capitalists prevailed in industry and trade as well as on the military fronts. Improvised military measures were everywhere the order of the day.

Whether or not without the civil war, war communism would have been a normal stage of Communist policy is largely an academic question, for it is hardly conceivable that after so sweeping an event as the October revolution the former privileged class would have failed to make some effort by military measures to regain what they had lost. As the civil war broke this counterattack on the military front, so war communism eliminated the bourgeoisie from all the positions of vantage it had previously held in the social system and crushed its resistance. War communism was a product of civil war, not of an a priori utopia; and as such it was simply a continuation of the political revolution of October, 1917. And when the third stage, the period of the NEP, or New Economic Policy, succeeded war communism at the close of the civil war in 1921, the change was a return to "normal" conditions, not a retreat from a shattered utopia.

The keynote of the NEP was the abolition of grain requisitioning and the restoration of free

trade in grain for the peasant. As a corollary of this there followed abolition of the centralized organization and distribution of supplies and the restoration of the retail and wholesale market. The decentralization of economic administration took the form of the reorganization of the industrial departments of the Vesenha into organs of general supervision and control and the organization of industry, still almost entirely nationalized, into "trusts," which with a few exceptions were horizontal combinations responsible for the detailed administration of the constituent plants. Some of them embraced plants of all-union importance, others operated to a large extent within the area of a single republic and the smallest were limited to single regions or provinces. The trusts were state bodies in the sense that their fixed capital was owned by the state, their directorate was appointed by the economic council of the state, their production programs were subject to the approval of the appropriate economic council and their accounts were audited and their reports scrutinized by the same council. At the same time they existed as separate legal entities and functioned as financially autonomous bodies: their working capital stood in their own corporate right and they were free to engage at their discretion in commercial transactions such as purchasing raw materials, hiring labor, marketing their products (subject only in some cases to price restrictions), raising credits and the like. A similar position of legal and financial autonomy was also restored to the co-operatives. Private trade was legalized, subject to the grant of a license by the appropriate state authority; private traders were liable, however, to a discriminatory business tax. Foreign trade, however, remained strictly controlled; all import and export transactions were subordinated to the program of the Commissariat for Trade. Provision was also made for the formation of joint stock companies, with capital provided by various state organs, and of mixed companies, with joint state and private capital, to operate in the sphere of wholesale and foreign trade. In 1923 and the following years the trusts in the various industries took advantage of this provision and organized on their own initiative "syndicates," to which they delegated the functions of selling their products and of purchasing the necessary raw materials. In the course of time many of the syndicates took over the general regulation of the industries with which they were dealing. By giving "preliminary orders" to the various trusts, by extending credit to them out of

the working capital accumulated from commissions or profits, by recommending concrete measures for improvements in quality and in various other ways the syndicates became very influential in shaping the production policies of the trusts.

During the first five years of NEP practical questions of reconstruction held the stage. It was necessary to overcome a succession of numerous "crises" and to start the wheels of industry again. The NEP represented a transitional system under which a predominantly nationalized industry adapted itself to the environment of an agricultural country of primitive individualist peasant cultivation. Since this adaptation implied a market relationship between the state and peasant economy, the economic characteristic of this period consisted in the manoeuvring on the market of state industry organized in financially autonomous units. Ordinary commercial forms, practises and relationships prevailed; and the state in adapting itself to the market and to peasant agriculture was ipso facto limited and conditioned by it.

When the period of reconstruction came to a close, the question of the next stage of advance appeared in an urgent form. This question was a crucial one; how to build socialism in a backward peasant country? As soon as such a task was set, the situation demanded no longer merely an adaptation to the peasant market but the controlling of that market, the appropriate transformation of the environment itself. The question as to further advance had already been posed by Lenin in 1920 at the close of the purely politico-military stage of the revolution. He had answered it with the slogan of electrification. To Lenin's view the political revolution, the intrenching of the working class in power and the uprooting of the old privileged class, was the prerequisite of an economic revolution which would necessarily follow it. The economic revolution was the more lengthy process of building stone by stone the structure of a socialist economy. In a backward peasant country this could be done only on the basis of industrialization or mechanization of the economic system. It is part of the Marxian doctrine that handicraft production creates the system of petty properties and petty trade, whereas the Bessemer process, electricity and the conveyor system produce corporation enterprise, the combine and the trust. In accordance with this view socialism in Russia could develop only on the basis of twentieth century technique; and the economic revolution had

to be simultaneously a technical revolution and a social revolution, the latter being unthinkable without the former, the former being inseparable from and subordinated to the latter.

Before this technical-social revolution could be achieved, the fundamental issue as to the position of agriculture under conditions of rapid industrialization on a socialist basis had to be faced and settled. In the latter half of the reconstruction period it became clear that under the conditions of NEP there had been a certain revival of class differentiation in the village, in particular the reappearance of a class of embryo-capitalist rich peasants, the *kulaki*. And while any appreciable development of industry necessarily rested on a growth of the agricultural surplus necessary to give food and raw materials to industry and grain for export, there seemed small chance for agriculture to develop at anything but an extremely slow rate unless the recrudescence of semicapitalist *kulak* agriculture was definitely encouraged. This problem became particularly acute in the summer of 1928, when instead of exporting grain Russia had to import it from abroad. During the two previous years the issue had been thoroughly discussed in theoretical journals, in the press, in party and Soviet meetings and conferences. This discussion period had two main phases: the acute controversy between the official majority of the party and Trotsky, who wished for a forcing of the pace and advocated "socialist accumulation" at the expense of agriculture; and that between the opinion championed mainly by Stalin and the so-called Right wing, which was inclined to preserve for a longer period the forms characteristic of the reconstruction period. These were no mere academic issues, nor were they simply a façade for personal rivalries. They were vital differences of view as to the way of building socialism in a peasant country; and the answer to the question offered the urgently needed key to immediate practical policies. History was at a crossroads, and once a decision had been taken there could be no turning back.

The alternative decided upon was to go beyond the limits imposed by the NEP, involving the adaptation to a peasant environment as its keystone, and to effect a new social revolution in the countryside. Already at the fourteenth congress of the Communist party in 1925 maximum possible industrialization had been approved as the correct policy in the stage following the reconstruction period. This was interpreted as implying special insistence on the

growth of "heavy industry" to provide the basis on which the transformation of the lighter finishing industries necessarily rested. At the fifteenth party congress in December, 1927, this policy was reiterated and combined with its essential corollary, the policy of agricultural collectivization. The reorganization of agriculture on a collective basis was to take two forms: the development of giant state farms, the *sovkhozy*, mostly on previously uncultivated land in north Caucasus, Siberia, Kazakstan and elsewhere; and the formation of collective farms, the *kolkhozy*, by inducing the peasants to pool their land, livestock and implements and to farm co-operatively. On these large scale enclosed farms the most up to date American methods of mechanized agriculture were to be introduced: the social revolution in the village was to provide the basis for a technical revolution in agricultural methods. This double policy was embodied in the Five-Year Plan of 1928, in which it was provided that 18 percent of the agricultural area was to be collectivized by 1933 and that by that date 43 percent of the marketable surplus was to come from state and collective farms. Actually the results of this daring agricultural revolution, which at first aroused extreme skepticism inside as well as outside Russia, surpassed the expectation even of its originators. By virtue of a mixture of "pressure," of economic inducements and of propaganda the provisions of the plan for agriculture had already been exceeded by the harvest of 1930; with the result that Russia was again able to appear on the world market as an exporter of grain on a considerable scale. By the summer of the following year it was claimed that one half of the peasant households of the whole Soviet Union were organized in collective farms and that over 60 percent of the total cultivated area was under state and collective farms.

The period of the NEP afforded the breathing space necessary not only to settle important issues of policy and to reconstruct and consolidate the national economy but also to develop the administrative apparatus for planning, to acquire experience in planned control on a smaller scale and to train a new generation of administrators drawn from the ranks and thoroughly imbued with the ideal of building a new planned economy.

Virtually the first act of preparation for the achievement of an industrial revolution on a socialist basis was the establishment in 1920 of the Goelro, or the State Commission for Electrification, at the personal initiative of Lenin. It

prepared a plan for the electrification of the country which covered from ten to fifteen years, and which was approved by the Eighth All-Russian Congress of Soviets held in December, 1920. In the following year it was reorganized into the Gosplan, of which the president of the Goelro, Krzhizhanovsky, a prominent engineer and an old friend of Lenin, was appointed president. At that time the Gosplan was composed of forty leading workers, mainly economists, statisticians and engineers. Only a few of these were Communists: the remainder were specialists carried over from the old regime. Subsequently successive reorganizations and enlargements took place, until at present the Gosplan employs a large staff of technical experts controlled by a praesidium of twenty-two persons. It is divided into departments whose work is coordinated by the bureau of national economic planning. In addition to departments serving the purposes of internal organization there are departments charged with planning power supply, industrial output, agricultural output, industrial and residential construction, the work of transport and communication services, the distribution of consumers' goods, the training of labor and technical personnel, general education and scientific research. Subordinate to the Gosplan are also a number of planning organs for constituent areas of the union: for each constituent republic, for each economic region, such as the Urals, and for each province. In addition the various people's commissariats, concerned with economic affairs, and the cooperatives have specialized planning departments which work in direct contact with the Gosplan in framing the plans for their particular spheres.

The Gosplan is a purely advisory body. Although in 1923 Trotsky proposed that it should be clothed with executive powers, the proposal was rejected on the ground that it was politically inexpedient to give such decisive powers to a body of bourgeois specialists with merely a sprinkling of Communists among them. The Gosplan passes judgment on the plans of all economic departments and tenders that judgment directly to the highest organ in the economic sphere, the STO, by whose decisions the recommendations of the Gosplan become executive orders.

Next to the STO the most important administrative body in the economic sphere is the Vesenha. This body was instituted in the first months after the revolution as the supreme controlling organ in economic affairs. But at the end

of the civil war period, when the wartime Council of Defense was reorganized into the Council of Labor and Defense, or the STO, and became the supreme coordinating body between economic departments, the Vesenha was appointed *de jure* to the role to which it had in fact been progressively tending, that of a virtual Commissariat of Industry. Until 1930 the Vesenha was organized on the basis of departments corresponding to each industry (*glavki*). In 1930 the syndicates, which had been gradually and spontaneously assuming large administrative powers over industry, were transformed into "combines," most of the industrial departments of the Vesenha being abolished and their functions transferred to the combines. Unlike the old industrial departments of the Vesenha the combines are financially autonomous bodies and separate legal entities. The Vesenha itself is now divided almost entirely into functional departments. The most important of these is the planning section concerned with preparing the economic plans in consultation with the Gosplan and also supervising technical research, improvements and rationalization. The next in importance is the department of inspection and audit, an organ of *ex post facto* control over industry. Finally, it includes a pricing and costings section and research departments concerned with industrial technique, geological surveying and geodesy. The Vesenha is directly concerned only with industry which operates on an all-union scale. Enterprises which serve a purely local market are organized in trusts of a purely local character, and these come under the control of economic councils of the various republics or provinces.

Initially the Gosplan took over and reorganized the work that had formerly been divided among ten or more different "central commissions" and "high commissions" attached to various commissariats. In the succeeding years it played an important role in planning the reconstruction of the economic system after the ravages of war, civil war and famine: the overcoming of the fuel crisis and the transport crisis in 1921-22, the reorganization of industry on the basis of the new trusts in 1922-23, the handling of the "scissors crisis" (the disequilibrium caused by the high prices of manufactures as compared with those of agricultural products) in 1923-24, the monetary stabilization of 1924 and the inflation crisis of 1925-26.

The most important general tasks which have characterized the work of the Gosplan in the

past decade and which most fully represent the qualitatively unique function of the Gosplan in the economic system have been three in number. The first was the preparation of the scheme of regionalization of the Soviet Union: the division of the country into economic regions as the essential preliminary to the industrialization on the basis of the localization of specific industries in the most suitable regions and of the geographical grouping of associated industries in the most economical way. At the base of this lay important geological and climatic considerations; and connected with it and in part dependent on it were questions of the development of transport, of raw material resources and of electrification.

The second and later task was the preparation of the "control figures" of the national economy in 1925-26. These early control figures were a combination of statistical data, estimates and forecasts, representing the objective factors in the situation, with purposive directions as to the lines and the goal of conscious economic activity. The combination of the two formed the co-ordinated plan or program by which the activities of all organs of the state with economic functions were to be directed. The period covered by these control figures was one year.

These first control figures, continued in an improved and elaborated form ever since, were a preliminary manoeuvre, as it were, for the third and crowning task of the Gosplan, the preparation of a five-year plan in 1927. The early control figures were admittedly crude and imperfect; they were based on inadequate statistics and the directives which they implied were not closely enough related, either in conception or in execution, to concrete realities. In the following three years, however, a considerable improvement in statistical information and the technique of gathering statistical data was achieved, much valuable experience was garnered and the apparatus of planning was developed and improved. In 1928 the preliminary draft of a five-year plan of the preceding year was succeeded by a still more ambitious draft, which fitted into the wider perspective of a more vaguely sketched twenty-year plan. Within the limits of the five-year plan provision was made for annual control figures to adapt in greater detail the program for the coming year to the results of the previous year and to the changing requirements of a developing situation. The new draft was prepared in a maximum and a minimum variant, the latter being based on less favorable assumptions regarding crop yields, improvements in the pro-

ductivity of labor, availability of foreign credits and benefits to be derived from foreign trade; the difference in anticipated accomplishment averages about 20 percent. The Fifth All-Union Soviet Congress of 1928 adopted the maximum variant as the state economic program for the period from October, 1928, to October, 1933, which is the now famous Five-Year Plan, or Piatiletka. Later the control figures for 1930 and 1931 have revised the figures of the plan drastically in an upward direction under the aim of "carrying out the Five-Year Plan in four years."

In the earlier period of its life the role of the Gosplan was mainly that of a coordinating body; it passed judgment on plans which were originated elsewhere. After the various economic departments and the cooperatives had drawn up their separate programs for the coming year in the form of budgets covering capital investments, output and price policy, estimated profits, credit requirements and the like, the Gosplan reviewed these, coordinated them and advised revision in an upward or a downward direction in any particular. There arose, for instance, such questions as the harmonizing of the relative growth of agriculture and of industry; of the work of the cooperatives or of the railways with the requirements of the commodity turnover; of the demands of industry for credit facilities with the resources of the State Bank and the policy of the Commissariat of Finance; of the import and export program of the Commissariat of Trade with the needs of the internal market.

As the period of reconstructing industry came to a close and the period of entirely new construction began, the function of the Gosplan ceased to be predominantly passive and became the active role of initiating policy in accordance with the directives of the party and the government. Decisions concerning capital development and the process of industrialization of the country—the proportion of resources to be devoted to capital construction, the relative rates of development of different parts of the economic system—were preliminary to the making of sectional plans; and the mobilizing from the center of the resources for construction work—allocations of capital to industries, distribution of raw materials and the like—became the prerequisite of any detailed program. It became the duty of the Gosplan to set the tempo of the whole economic system and to establish the main lines within which the various sectional programs were to be prepared. Of this new role the Five-Year Plan was the concrete expression.

It is not to be inferred, however, that the Five-Year Plan is a merely abstract creation, imposed bureaucratically from above. The Gosplan postulates the goal and the main directives in a preliminary draft plan, commonly after general discussion by conferences of planning workers. This draft is then submitted to the Vesenha, the commissariats of Transport, Agriculture, Trade and Supply and to the cooperatives, and from them is passed on to their constituent bodies until it reaches the lowest stage, the factory, where it is customarily discussed by a general conference of all the workers. On the basis of these discussions amendments are suggested and the skeleton is clothed in the flesh of more detailed formulation. These fuller, more detailed departmental programs are then submitted again to the Gosplan, which has the task of passing final judgment on them. Even when these plans have reached the final stage of adoption by the S.T.O. they are binding on the economic system as general directives rather than as hard and fast bureaucratic regulations. Considerable latitude exists in practise for adaptation by the subordinate organs to actual circumstances, and subsequent modifications are frequently suggested by them in view of unforeseen circumstances, these changes being sanctioned either before or after execution.

Since the relations between various units even within the socialized sector of the national economy take the form of contracts of purchase and sale at specified prices, the regulation of prices, wages and salaries, the policy of long and short term credit extension and the system of taxation must be closely coordinated with the instructions concerning material accomplishments furnished by the Five-Year Plan. An important constituent part of the Five-Year Plan is therefore the financial plan, embracing estimates of all financial operations under state control, such as the state and local budgets, the capital accounts of the economic organizations and social insurance funds, and long and short term credit plans. The degree to which the anticipations of the financial plan are carried out also throws much additional light on the execution of the plan of production and consumption as measured in physical units. Since the financial plan is of such importance, the organizations responsible for its drafting and execution—the State Bank and the Commissariat of Finance—occupy a somewhat more independent position with reference to the Gosplan than do the other economic commissariats and the cooperatives.

The keynote of the Five-Year Plan is the mobilization in capital investment or construction work of an average of 30 percent of the national income for each of the five years and a doubling of the national income between 1928 and 1933. If account is taken of the growth of population, which is a rapid one, the national income per capita is expected to increase by 80 percent, while real income available for consumption purposes to the urban and rural population will rise by some 50 percent. The rate of economic development thus provided for is about six times the normal development of world production and more than twice that achieved by industrial countries even in boom years. A more detailed analysis shows that the rate of growth planned for industries engaged in the production of capital equipment and industrial raw materials and supplies is larger than that for consumers' goods industries, and that the anticipated increase of the share of national income under direct control of the state apparatus is greater than that of private undertakings.

Economic planning is not of course a new invention. Improved methods of "scientific" business planning have been the common talk of capitalist business since the last quarter of the nineteenth century, and with the growth of monopolistic capitalism the sphere of such conscious control over economic activities has progressively widened. During the World War and again in recent years, largely under the influence of Russia's example, there has been increasing discussion of a planned economy under the aegis of the central bank, trade associations, public corporations, cartels and syndicates. What is new in the Gosplan system is the subordination of the whole economy of a country to a single plan. Under a regime of private capital the sphere of conscious control is necessarily limited to the individual property unit. Between such units the relation must be predominantly that of *laissez faire*. In these interstitial relations the state may intervene with negative restrictions and indirect controls, as occurred on a considerable scale in most belligerent countries during the war. But it cannot without infringing the basic principles of private property exercise direct, positive and initiating influence as under the planning system in operation in Russia after 1928. In other words, whereas in a capitalist society extension of state functions might conceivably go so far as to approximate the system prevalent in Russia under the NEP, these functions could not extend to anything so radical as the

planning system in operation during the period subsequent to 1928.

Another distinguishing feature of contemporary Russian economy is that it attempts to carry out the process of industrialization, the transformation of a country of primitive productive methods into a country of up to date mechanical technique, at a much more rapid tempo than had been witnessed during the industrial revolutions in England in the beginning and in the United States in the middle of the last century, in Germany in the 1870's and in Japan at the turn of the century. It attempts to achieve this tempo by consciously mobilizing and directing capital resources and planning their utilization, as in England or America a large combine might plan and direct the reorganization of the plants under its control.

There are in addition certain subsidiary features of Soviet planned economy which are hardly conceivable apart from the historical process through which Russia has passed since 1917, and which are likely to render western analogies to it incomplete. These characteristic features center about the peculiar role of the Russian Communist party in the successful operation of the Five-Year Plan. In capitalist countries uniformity of executive policy is achieved through the medium of a highly trained and trustworthy civil service. The more educated and reliable the civil service, the more initiative can be left to individuals and the better can unity of policy be combined with requisite flexibility in detail. In Russia, where the old czarist officialdom hardly possessed these qualifications and by its social composition and training was unsuited to the operation of a socialist planning system on so extensive a scale, the Communist party is not only the governing party in the legislature but also the unifying and guiding hand in the execution of policy. As such the Russian Communist party provides a new historical type of party. It is by reason of this double function that severe qualifications are imposed for admission to membership in the party and a strict internal discipline is maintained. The party is not, however, an exclusive official caste, and the execution of the plan does not primarily depend on the efficiency of an official hierarchy passing down orders from above and "putting across" orders in military fashion. Lenin defined the dictatorship of the proletariat, which for him was the necessary political form of the transition between capitalism and socialism, as a state that embodies a new kind of democracy for the prole-

tariat and the dispossessed and a new kind of dictatorship against the bourgeoisie and as being necessarily fulfilled through the instrumentality of special institutions of a new type, the soviets. As has been mentioned above, the construction of the plan is the work of the subordinate organs, including factory meetings, to the same extent as it is of the Gosplan itself. Similarly, the execution of the plan depends as much on the activity and initiative of the workers themselves as on the directions handed down from above. It is one of the essential features of Communist theory that the party's duty is not primarily to give orders, but to lead and to guide, to stimulate the masses in playing an initiating role in creating and executing the plan. There is no democracy in Soviet Russia in the sense of parliamentary democracy with a multiple party system. But there exists in Russia's planned economy something that may be called a workers' democracy. It is a new type of democracy in the sense that collective interests secure fairly full expression through the apparatus of soviets, trade unions, factory conferences and the like; and that a large part is played by rank and file participation and initiative in framing, adapting and executing the plan. This schooling process of active workers' democracy has played an important role in developing a new generation of industrial administrators from the ranks of the workers. And it is through this active participation of broad masses of the population that the eventual "withering away of the state" (as a hierarchy separated from the people), which figures in Marxist theory, is conceived as being attained.

A planned economy seems to open considerable possibilities of adapting the various branches of the economic system to one another and eliminating industrial and financial crises more successfully than is done under a system of laissez faire. Moreover, not only does it reduce risk and uncertainty by the pooling of risks and by eliminating competition but by planning capital investment and technical change it can considerably reduce those uncertainties which usually characterize economic forecasts. The chief difficulties of a planned economy are those of administration and of human factors: the difficulty of finding the requisite ability to handle problems on so large a scale. Its potentialities therefore seem to be limited not primarily by economic considerations but by the quality of personnel and by administrative inventiveness.

The building of a planned economy in the Soviet Union is bound to have important effects

on the rest of the world. It may mean to some extent an invasion of important markets in other countries by Russian manufactured goods. But the aim of Russian planning is to make the country self-sufficing. For a long time to come its growing internal market is likely to absorb its output of industrial goods; indeed, with the relaxation of the immediate pressure of the early years of planning, which is responsible for the forced export of certain goods at present, Russian exports of manufactured goods may actually decrease rather than increase. Russia is likely to remain primarily an exporter of raw produce; but since it does not export capital and so needs no export surplus, it will continue to buy from other countries as much as it sells. Therefore the effect of the Five-Year Plan on the rest of the world through purely trade channels will probably be much less than is popularly imagined. Its effect on the rest of the world will certainly be profound, but it will be on another plane. The influence of the social theory for which it stands and as pointing the way for the social and economic thought of the West both as a concrete challenge to the backward peoples of Asia as well as to the working class of developed industrial countries may well be epoch making. And it seems likely to have some immediate concrete influence in encouraging various planning schemes in other countries. Such transplantation to capitalist countries, however, seems to be confined within fairly narrow limits. To copy it on any extensive scale in the west would be inconsistent with the basic principles of individualist enterprise, the profit motive and the association of control with risk. Moreover, certain features of Soviet planned economy, which are essentially the product of the whole process of the Russian Revolution, seem to make the system qualita-

tively different. They have the significance of chemical elements the addition of which transforms the character of the whole composition. If this be so, these specific features are particularly important to understand.
